The Oaks Co. is breaking ground in its main drainage and transportation tunnel on Mineral creek, which will eventually tap the leading vein systems of the camp at various depths up to 1800 ft. Road to the tunnel site has been overhauled to facilitate traffic to that point. At the Eberle mine, drifts are being advanced both north and south from 50-ft. level in exploratory shaft, which is equipped with a Fairbanks-Morse 15-hp. gasoline hoist and compressor plant. Present development on the Clifton mine consists of driving south drift from adit level and raising on No. 1 ore body.

The aerial wire rope tramway from Pacific mine to Socorro Mining & Milling Co.'s plant 1 mile distant, has been completed and operates perfectly. The adoption and placing in commission of this system of transporting the Pacific product marks the end of an era of operation during which 11,162 tons of ore carrying a gross value of \$171,585 were mined in a crude way and shipped to local custom mills by the burro train. While the general average of ore mined in the Mogollon district for same period has been around \$12 per ton, that from the Pacific had an average of \$15.37, and with the more adequate mining facilities now employed,

in connection with modern tramway delivery to mill, the property may be expected to soon eclipse its past record and take rank with the best producers in the camp. Operations are being conducted by Socorro Mining & Milling Co. under agreement with the Oaks Co.

Red River.

A tunnel is now being driven by the Buffalo New Mexico Mines Co., which will serve surrounding properties which are now idle because of the haulage question. The Dorothy tunnel is being run to cut the Silver King vein of the company. It will not only be a means of unwatering this particular section of the district but will be the means of putting thousands of tons of ore in shape to be mined that would otherwise be undeveloped on account of the expense of fuel, haulage and pumping. The Placer creek region which the tunnel will penetrate is a large mineral zone with massive quartz fissures. The Silver King shaft is 200 ft. deep. Drifting and crosscutting has proven the ore shoots to be of good length and breadth, and shown an increase in values from the surface to the present level. The ores are silver-gold.

NORTH CAROLINA.

Charlotte.

Charlotte and Concord parties are opening up the old Pioneer Mills gold mine, which is situated 16 miles from Charlotte. This mine has not been worked since 1862. A stamp mill for demonstration work has been erected.

G. W. Jackson, of Lenoir, N. C., who owns the Fleming gold mine, is making plans to work it. He has rebuilt his reservoir dam and expects to rush operations.

Charter has been granted the Avery Feldspar Co., of Bewland, N. C., with a capital stock of \$10,000.

The Consolidated Sales Mining, Milling & Mfg. Co. is a new concern with \$100,000 paid capital and \$1,000,000 authorized. Objects of the company are to prospect for gold, marble, and other minerals. Officers of the company are J. Frank Wilkes, M. Greenendyke, and R. Burdge.

Southern Pines.

F. A. Lane has been here looking over the old Cumnock coal property with a view to developing. Lane is now awaiting some drill records from State Geologist Joseph Hyde Pratt.

Kinston.

A report states that Lon Hines is considering the development of marl deposits on 300 acres of land in Jones county.

Stony Point.

A company has been incorporated here to establish a plant and mine asbestos. Capital stock of the corporation is \$10,000. G. B. Holeyberton is president; J. S. Kever vice president-treasurer and J. W. Sims secretary.

Referring to the possible location in North Carolina of a government armor plate plant State Geologist J. H. Pratt states that North Carolina probably has the largest deposits of chromite of any state in the east. To a depth of 100 ft. there are at the present time iron ores available, according to Pratt, as follows: magnetite 650,000 tons; titanite magnetite 1,510,000 tons; hematite 250,000 tons; limonite 750,000 tons.

OREGON.

Sumpter.

C. L. Camp, superintendent for the Susan D. Mines Co., says that development has exposed free milling ore that averages \$22 in gold to the ton. It lies in a shoot 1 to 8 ft. wide exposed for 325 ft. at an average depth of 175 ft. This development was performed by the company, during the current year. The equipment includes a 10-stamp mill. Production from the mine is in excess of \$1,200,000.

The Sumpter smelter which was closed in 1907 was purchased a few months ago by J. A. Gyllenberg. Considering

better conditions which prevail now Gyllenberg is giving due consideration to the question of reopening the plant.

SOUTH DAKOTA.

Silver City.

The Saunders mine has been taken over by the Home Lode Mining Co. The company has sunk to the 100 level, where considerable water was encountered. Drifting on this level revealed a vein which did not show on surface and is found to be very good. Work of developing the new find is being continued. As soon as new pumping machinery can be installed the shaft will be lowered, probably to the 300 level and drifts started to the vein.

The Omega has been taken over by the recently formed Pactola Dev. & Mining Co. Development will start immediately. The deposit is described as a large body of low-grade free milling ore assaying from \$2 up.

UTAH.

Beaver.

Owing to the development recently of good bodies the directors of the Antelope Star have decided to immediately erect a mill. This work it is said will be begun in December.

Electrical equipment has been installed at the Paloma and a fan is now used to drive out powder smoke from blasting. On the 600 level according to C. J. Graft 6 ft. of ore is showing which runs 19% lead; 37 ozs. silver; 0.02 ozs. gold and 20.63% copper in places. The richest values are appearing in the monzonite. When the lime was encountered the fissure narrowed down. Along the contact some ore is appearing. Indications at present are that some high grade and large bodies will be found in the monzonite. In another drift on the 600 hanging wall side, 18 ins. of carbonate that will carry \$45 is being found. This is in the lime fissure. The drift sent out on the 600 to cut the contact has gone through the lime that was expected and has encountered another body of monzonite. Instead of a fault in the monzonite as expected it has developed that a fault has caused the displacement that led to belief that there had been a faulting of the formation. The shaft is down 55 ft. below the 600. It is the intention to continue sinking to the 700 before starting lateral work. The Indian Queen will soon drive a drift 100 ft. out from the old tunnel. This is expected to intercept and determine an extension of the fissure where the ore bodies make. Lessees have been given control of another block of ground which they will start developing. Recently Indian Queen shipped 3 cars.

In a recent strike at the Leonora 20 ins. ore was found which runs 91 ozs. silver, 5% copper and 5% lead. Supt. Nebecker says that this was on a fissure directly under the old workings, and at a depth of 450 ft. A fault was encountered, but late developments point to the fact that the intersection of the cross fissure will result in the restoration of the ore, evidence of which is to be found in the softening of the lines and the improved mineralization.

Milford.

The first car of company account ore has been shipped from the Creole; the property is being electrically equipped and things are in a revolutionary condition in general. A new compressor and electric hoist are to be installed. Two good showings of copper ore have been opened up. On the 100 level is 11 ins. of copper. This is a high grade ore, while on the 150 level there are 16 ins. of high grade.

The stope of carbonate at Silver King Con. is proving satisfactory. The work is being done between the 1550 and 1625 levels. On the 1625 level new ore disclosures have been made lately and the ore is going down strong. First-class ores from this mine range from \$15 to \$65. A group of directors who recently visited the property report: The new Thaynes tunnel is in 960 ft. and making progress. This will develop and drain at depth a large and important terri-

tory of the company. The new 10,200-ft. tramway is completed and is operating smoothly. It has a capacity of 200 tons. The 50-ton mill is being completed and new ore disclosures in the deeper workings are reported important.

As soon as teams can be secured further shipments can be made. The bins are full and 4 to 5 cars will be shipped each week. Within 10 days it is expected that the company can be marketing from 7 to 10 cars a week. The car just shipped will average 6% copper with values in gold and silver. D. H. Ferguson is superintendent. A force of 10 men are at work. This force will be doubled as soon as arrangements can be completed.

Lund.

At No. 3 lease of the Mines Development Co. a compressor and drills are being installed and the boarding and bunk houses about completed. Pres. R. W. Brown reports three places at which 23% to 39% ore can be mined. The mine has been developed with an incline shaft down 85 ft. and a drift running east and west from the bottom of the shaft. The west drift is out 40 ft. The face is in a broken formation of manganese, iron and lead sulphides, which will probably turn into solid ore. Streaks of ore from 2 to 3 ft. thick show on both sides of the drift for its full length. There is a raise from the east drift in which 1 ft. of 30% lead is exposed. The 23% ore is at surface, near a glory hole. There is a large tonnage of this ore which can be taken out through this glory hole.

Eureka.

Walter Fitch, Jr., has taken a contract to drift from the 1200 level of the Victoria to the property of the Plutus Co. The drift will cut through Victoria, Eagle, Blue Bell and Plutus. The expense will be taken care of by all companies interested. In the neighborhood of 300 ft. of drifting will be necessary before the drift reaches the Plutus territory. Another drift is being driven into the Plutus from one of the lower levels of Chief Con. This work, as well as practically all of the development work in the Chief Con., is being handled under contract by Fitch.

Yankee Con. has made a strike of high-grade silver in the Hamburg workings. The face samples 175 to 570 ozs. silver, 15 to 20% lead and \$1 to \$20 in gold. Some of the assays showed \$300 to \$400 to the ton. Yankee is also carrying on extensive development in a ledge of quartz next to where the Beck tunnel took out several pockets of ore that brought \$30,000 to \$10,000 each. Leasers are shipping several carloads a month of first-class ore.

WASHINGTON.

Spokane.

The Silver Bell Mining Co., capitalized for 1,500,000 shares at \$1 each, of which 500,000 shares are to be held in the treasury, has been organized to take over and continue development of the old Spokane Belle mine, 4 miles from Clayton, one of the oldest mineral locations in the state. E. E. Belden, attorney, is president; R. F. Blackwell, formerly general manager of the Idaho, Washington & Northern Railway Co., is vice-president, and Mrs. Estelle McCabe is secretary-treasurer. The president and vice-president, with James M. Fitzpatrick, treasurer of the Union Iron Works Co.; H. N. Metzger, treasurer of the H. J. Shinn Co., and James A. Broad, construction contractor, compose the directorate. All are residents of Spokane. There are three parallel veins showing on the Silver Bell property, and they have been proven for 500 ft. by a series of surface cuts. A 43-ft. shaft has been sunk on the north vein and a 93-ft. shaft on the south vein. It is planned to sink the latter to the 300-ft. level, and then crosscut. Average assays show values of \$26 in silver, and picked samples ran \$59 to \$149, according to President Belden. A shipment of 2 cars to the Northport smelter a number of years ago netted \$26 a ton.

Chewelab.

After a suspension of 4 years the United Copper Mining Co., which owns and operates the United Copper mine, has resumed dividends. The directorate on Nov. 11 authorized

a disbursement of 1 ct. a share, or \$10,000, payable Dec. 15. This will make the total payments \$50,000, four distributions of \$10,000 each having been made prior to suspension. "The mine is in fine condition, and, while our values are not high, with the immense tonnage that has been proven, the increased milling capacity and the close saving being effected I believe we will be able to maintain dividends indefinitely," said Conrad Wolfe, president and general manager. "The report for the quarter ended Sept. 30 shows that the company still has outstanding indebtedness, but earnings are increasing steadily and will be considerably augmented after Jan. 1, when we will have both the mine and mill operating more efficiently. If copper and silver prices remain near prevailing levels we will be able to make large dividend payments in 1917." The quarterly report states that, after 18 months of experimentation a treatment has been devised that is resulting in saving 90% of the copper values and 92% of the silver. While metal prices have held at good levels during the period, wages and the cost of supplies have increased, adding materially to operating expenses. A tract of land below the concentrating plant was purchased for \$7,500 to obviate a threatened law suit, and considerable was expended in improving and adding to the mine and mill equipment.

WISCONSIN-ILLINOIS.

Platteville.

Reports covering operations of the field this week ending Nov. 18 show deliveries to track of 124 cars of zinc ore, 4782 tons, an appreciable falling off from the usual figures. Three cars of lead ore cleared 107 tons, all from the Benton district. Unheard of prices for pyrites failed to stimulate shipments and only 698 tons cleared. The gross turn-in of crude concentrate for the week was 4267 tons; net shipments to smelter 2883 tons. Jersey Zinc Co. delivered 15 cars of high grade separator product to smelter at DePue, 678 tons. Prices went soaring for the week, the base on 60% standard ore and premium grades holding at \$93.00. An advance of \$5 was noted on medium and second grade ore. Lead ore advanced to \$87.50 per ton and pyrites, usually selling at \$4.50 to \$5, advanced to \$10 per ton.

Locals were not much in evidence. The Bell Mining Co. with a complete rig started mining and milling on the Graham-Stephens property with success.

Benton.

A new mining and concentrating plant housing a 9-cell jig was started on the Grotkin farm for the Frontier Mining Co. The new plant has been provided to take care of zinc found just under the flint bed at a depth of 80 ft. and an equal distance above the oil rock, where the Bull Moose range makes exceptionally heavy. Should this top run not prove as profitable as anticipated the shaft will be dropped down 80 ft. picking up the oil rock run.

The new Hird mine, with full rig, attempted operations on the shaft sunk in treacherous ground. Heavy timbering delayed ore recovery sufficiently to keep the plant from moving steadily. Work was suspended and the range is being opened up 1200 ft. southwest through a new shaft down 100 ft., where drills showed heavy zinc formations, and a strong cap rock. The dirt will be gravitated to the mill and will insure a steady diet. General Manager J. H. Billingsley declares they are still lifting 2000 gals per minute. The pumps are draining the entire range now proven for ½ mile to the southwest. Mine and mill will be going on 2-shift schedule not later than Dec. 15.

On the Calvert property the Frontier Mining Co. has discovered a new range going past the west end of the old Calvert mine, 50 ft. from the hanging wall. This range has been drilled out to the Robson fence and runs northeast. A drill was moved on the Robson lease to check up extensions. A drift was cut from the old Frontier basin west into the old Calvert basin, which was followed in northwest and now miners are on the breast with good results.

Drills have picked up zinc for the Frontier Co. on the

extreme south end of the Hird farm. It is contended that this find is a part of the range coming out of the first Hird basin, 3000 ft. north. Several small runs of ore are located with drill on the Robson, Calvert, Bainbridge and Whaley farms but to date none show volume warranting development. Two small deposits have been proven on the Schultz land one along the south end, the other 500 ft. north of this. Neither is large enough to justify building a mill. The company intends mining them from the Treganza and Frontier properties as they belong to the same range on which is now found the Burr and Frontier mines.

The Burr mine is yielding 4 cars of 45% zinc weekly. It is driving west and sloping toward the Schultz lease. A drill has been put to work on the property. On the Buck Hill lease some fair runs of ore have been proven on the Hughlett farm but not strong enough to insure a lode. The work continues and traces of ore are being found in the grey rock.

Shipments of zinc ore last week totaled 55 cars, 4,414,000 lbs.; nearly all producers being represented. Shipments of high grade separator ore were the lightest yet reported this season for a week. Longhenry Mining Co. and H. B. Pulsifer, Chicago, have interested capital in a local project held under lease. Indian Mound, Kittoe and other zinc producers contributed 3 cars of lead last week all going to the Federal Lead Co. The Grasselli Chemical Co. was the single heaviest buyer, taking 28 cars, 1061 tons, under contract. The Eagle Picher Lead Co. secured little ore. From the National Separators came 7 cars, high-grade ore, 263 tons. The American Zinc Co. secured most of the high-grade offered by independents.

Linden.

Saxe-Pollard Co. have opened up a zinc deposit at the Gilman mine. The breast is 135 ft. wide, undetermined as to length and carries several flat sheet deposits. Shipments of concentrate are running 8 cars weekly from this and other company mines.

Miffin.

The reserve estimated at 1800 tons on Nov. 1 is being eliminated. Fifteen cars were shipped last week, 570 tons. One car came from locals nearer Mineral Point, 28 tons. A slide at the O. P. David mine, at Montfort buried the east breast from which a fine showing in shipments was being made. It will take several weeks to clean up.

Galena.

Shipments from the extreme southern end of the field last week were light, Hazel Green reporting 8 cars of zinc, Shullsburg, 2; Potosi, 1; and Galena 7. No disposition was shown to ship high-grade.

WYOMING.

Cody.

A dividend for Xmas is being planned on by the Midwest Sulphur Co. The refinery product is running 99.5% sulphur. It brings in carload lots \$49 a ton for the brimstone and \$47 a ton for flour sulphur. Fifteen beet sugar factories in this section consume an average of about 15 cars a season. The Midwest Sulphur is turning out 20,000 lbs. daily. The production is still sold about 8 months ahead.

Greybull.

The American Oil Co. has erected its standard rig on section 18, which is in line with the oil bearing zone. The Lamb Drilling Co. has installed a rig on the ground of the Greybull Oil & Dev. Co. The rig that was on the ground was too light and was removed and a contract made with the Lamb Drilling Co. to sink a new well. The drill has reached 1000 ft. depth.

Lander.

R. C. Heslep is drilling under contract for the Five Hundred Corporate Oil Co. and Nate Levi. The Hudson Co., west of where Heslep is drilling, have 8 wells which are good pumpers. During December Hudson expects to start new wells on its lease.

CANADA.

BRITISH COLUMBIA.

Silverton.

The Galena Farm Mining Co., which owns and is operating the Galena Farm lead-silver-zinc property near the Standard Silver-Lead Co.'s holdings, is producing at a rate that promises to enable the corporation to retire its outstanding indebtedness soon, according to official reports. The company is controlled by the heirs of the late Patrick Clark of Spokane, who secured the Galena Farm group under bond from A. W. McCune of Salt Lake, Utah, a few months before his death. The Clarks and their associates hold 75% of the stock, and the remaining 25% is held by the McCune interests. A report issued by the company states that the gross income for September and October was approximately \$70,000, and that the net earnings for the period were about \$50,000, the most of which was devoted to the bond payments. Three shifts of miners are employed at the property, and the 100-ton concentrator, commissioned about 8 months ago, is producing about 35 tons daily, the output running high in lead and zinc. The vein from which ore now is being extracted has been developed for more than 300 ft., the shoot averaging 14 ft. wide, and it is said that there is a sufficient reserve to provide material for the mill for not less than 5 years.

ONTARIO.

The Bureau of Mines has collected returns from the metalliferous mines and works of Ontario, Canada, showing the production for the 9 months ending Sept. 30, 1916. Following are the figures for the period, and for purposes of comparison, figures for the corresponding period last year. It will be noted that there has been a large increase in the aggregate value, and also in the value of nearly all the individual products, due to causes mentioned in the notes appended:

SUMMARY OF MINERAL PRODUCTION FIRST 9 MONTHS OF 1916.

Product.	Quantity		Value	
	1915.	1916.	1915.	1916.
Cobalt (ore), tons.....	52	98	\$ 12,472	\$ 10,591
Cobalt (oxide), lbs.....	135,337	378,732	107,363	231,947
Cobalt (metallic), lbs.....	76,979	172,055	66,552	146,467
Cobalt and nickel oxides (unseparated), lbs.....	2,501	57,026	500	22,890
Copper ore, tons.....	1,715	21,685
Copper in matte, tons.....	14,057	16,989	2,024,658	6,285,320
Gold, ozs.....	281,712	363,955	5,826,941	7,513,734
Pig iron, tons.....	302,586	271,034	601,014	673,170
Molybdenite (concentrates), lbs.....	15,815	15,815
Nickel, oxide, lbs.....	112,483	51,152	16,085	6,381
Nickel, metallic, lbs.....	11,905	17,135	4,762	7,618
Nickel in matte, tons.....	24,054	31,046	5,369,536	15,523,000
Pig iron, tons.....	354,153	501,410	4,510,906	6,686,265
Silver, ozs.....	17,178,629	16,203,091	8,030,469	9,750,040

Cobalt.—The silver mines of the Cobalt district have definitely established their supremacy of the sources of the world's supply of this mineral. Notwithstanding the war, which has closed the European markets, the shipments of cobalt oxides were much greater, both in quantity and value than in the first 9 months of 1915. It will be observed that metallic cobalt is assuming an important place in the list. This is mainly due to its use in the manufacture of special alloys, principally stellite, for high-speed tools. Stellite is made of cobalt, chromium and tungsten, and is finding a good demand from munition makers and other workers of modern hard steels.

Copper.—The extraordinary rise in the price of copper, which averaged 27 cts. in New York during the 9 months, has brought about the opening of several deposits of copper ore chiefly west of Lake Superior, from which shipments have been made to British Columbia smelters. The principal of these mines is the Tip Top; another at Mine Centre has lately been sending forward a carload of ore daily. The price received by the shippers has averaged 18.5 cts. for the copper contents. This figure has also been applied to the

copper contained in the heavy shipments of matte from the Sudbury nickel-copper mines, and a considerable part of the increase in value of the copper reported is due to the higher valuation, although the quantity shipped was also greater by 20%.

Gold.—The output from the mines of northern Ontario is steadily increasing, being 28% in excess of that for the 9 months of 1915. Hollinger Con. continues to be the chief producer, accounting for 47% of the total. Dome followed with 21% and McIntyre-Porcupine with 10%. The other considerable contributors in this camp are Porcupine Crown, Schumacher, Vipond and Jupiter, which together furnished 5.5%. Outside of Porcupine proper, Tough-Oakes yielded \$519,149; Canadian Exploration, Croesus and a small output from Dome Lake amounted to over \$250,000. At Teck-Hughes (Kirkland Lake) the mine has been developed and a mill built which will be put in operation as soon as the power transmission line now being erected from Cobalt has been completed. Other prospects here, the Lake Shore, Wright-Hargrave, Kirkland Lake Gold Mines, La Belle-Kirkland and Sylvanite are also being developed. This is a promising camp. In Gauthier township the Huronian mine is being worked under a lease. Several discoveries of gold were made during the summer in Benoit township, but there has not been time to prove their value. At Tashota, the Tash-Orn Co. bought the Wells' claim and put in machinery to give it a thorough test. This company is also working the King-Dodds claim. A diamond drill has been operated on the Devaney, Reamsbottom and Clive claims.

Molybdenite.—There is a demand in Britain for tool making steel, and several deposits of the ore in eastern Ontario have been opened and are being worked. There are dressing plants at Renfrew and Ottawa, the latter operated by the Dominion Mines Department. Ferro-molybdenum is also being made at Orillia and Belleville. The supply of molybdenite throughout the British empire has been reserved as a war measure and a price of 105s per unit fixed for concentrates delivered at Liverpool. This approximates \$1 per lb. here.

Nickel.—The Canadian Copper Co. and the Mond Nickel Co. have been working their mines and smelters at maximum capacity, and the output of nickel, contained in the matte product of the furnaces, for the 9 months falls little short of that for the full year 1915. The production for 1916 will probably exceed the production of 1915 by 20%. The valuation of the nickel in the matte has been increased from about 11 cts. per lb. (the figures adopted by the mining companies) in 1915, to 25 cts. in 1916. Nickel refineries are to be erected in Ontario by the International Nickel Co. and the British American Nickel Corporation, the latter of which is developing the Murray mine. Small quantities of metallic nickel are being produced from Cobalt ores by the Deloro Smelting & Refining Co.

Iron.—The whole production of iron ore was from the Helen and Magpie mines of the Algoma Steel Corporation. At the latter the ore (siderite) is roasted previous to shipment. Four blast furnace companies at Port Colborne, Sault Ste. Marie, Deseronto and Hamilton respectively, produced pig iron in quantity 41%, and in value 48% greater than in the corresponding period of 1915.

Silver.—The mines at Cobalt continue to produce, though on a slowly diminishing scale. The number of fine ounces contained in the shipments of the 9 months was 795,538 below the record for the same period of last year, but owing to the much higher prices that have prevailed for silver the return to the mining companies was \$1,719,571 greater. Silver started the year at 56.76 cts. and rose to a maximum in May of 74.27 cts., when it receded to 63.06 in July, reaching 68.51 again in September. In 1915 the monthly average was 49.75 cts. Nipissing still leads in production, Mining Corporation coming next, followed by Kerr Lake, Coniagas, McKinley-Darragh-Savage, Seneca-Superior, Temiskaming, etc. The flotation process is likely to assist materially in increasing the production of silver at Cobalt. It has been introduced at the Buffalo mine, where it is treating successfully low-grade rock containing 5 or 6 ozs. per ton. From the gold ores treated during the period 66,317 ozs. of silver were obtained, and from the copper ores 607 ozs.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Antisell, F. L.; Skowronski, S.—*Electrolytic Copper Refining*. [Abstract from a paper read before the Amer. Inst. of Metals. The process is described from the melting of blister copper into anodes to the thermic refining of the cathodes resulting from electrolysis].—E. & M. J. Nov. 11 1916; p 871; pp 2¼; 25c.

Deshler, George O.—*Ohio Copper Concentration, Utah*. [A description of the flow of the ores and the slime plant and method for water recovery].—E. & M. J. Nov. 11, 1916; p 855; pp 1*; 25c.

Gahl, Rudolph.—*Operations and Methods in Use at the Inspiration Property,*

Arizona. [A flow sheet of the mill with considerable statistical data on the distribution of power, milling and flotation work].—Mg. World Nov. 11 1916; p 825; pp 3*; 10c.

McBride, D.—*A Trip Through Honduras, C. A.* [Deals mainly with the people, means of travel and accommodations, with more brief notes on copper and gold found in the country].—E. & M. J. Nov. 11 1916; p 851; pp 3½*; 25c.

Rickard, T. A.—*The Britannia Mine and Mill, British Columbia*. [Details on the mill equipment and operation, with further information on the mine workings and deposits].—M. & S. P. Nov. 11 1916; p 693; pp 8*; 20c.

Stander, H. J.—*Alaska Has One Up-to-Date Flotation Plant—the Kennecott*. [A description of the plant and the results which have been obtained].—Mg. World Nov. 11 1916; p 822; pp 1¼; 10c.

—*British Columbia Report of the Minister of Mines*. [On the production and mineral industry of the province].—Mg. & Eng. Rec. Oct. 1916; p 92; pp 1½; 35c.

—*Pretoria Inspectorate of Mines 1915 Annual Report*.—S. Afr. Mg. Jnl. Oct. 7 1916; p 122; pp 1; 35c.

—*Rhodesia Chamber of Mines Report of the Executive Committee*. [Tables of details on the production of gold and asbestos properties in the district are given].—Rhodesia Chamber of Mines Report Aug. 1916; pp 6*.

Gold Fields and Mining

McBride, D.—*A Trip Through Honduras, C. A.* [Deals mainly with the people, means of travel and accommodations, with more brief notes on copper and gold found in the country].—E. & M. J. Nov. 11 1916; p 851; pp 3½*; 25c.

Sibley, Robert.—*The Most Powerful Dredge Afloat*. [The dredge is in California and is electrically operated].—Jnl. of Elect. Power & Gas Nov. 11 1916; p 371; pp 3¼*; 35c.

—*British Columbia Report of the Minister of Mines*. [On the production and mineral industry of the province].—Mg. & Eng. Rec. Oct. 1916; p 92; pp 1½; 35c.

—*Pretoria Inspectorate of Mines*

1915 Annual Report.—S. Afr. Mg. Jnl. Oct. 7 1916; p 122; pp 1; 35c.

—*Rhodesia Chamber of Mines Report of the Executive Committee*. [Tables of details on the production of gold and asbestos properties in the district are given].—Rhodesia Chamber of Mines Report Aug. 1916; pp 6.

—*Transvaal Chamber of Mines August Analysis of Gold Production*. [Tonnage, yield, working costs, profits, dividends, etc., are given separately in tabulated form for each company].—Transvaal Chamber of Mines Aug. Report; pp 6.

Gold Milling, Metallurgy, Etc.

See Mill and Milling, Metallurgy, Chemistry, Assaying, Etc.

Lead

Larson, A. G.; Lakes, Arthur, Jr.—*Slocan Star Mine, British Columbia*. [Abstract of a report made by the authors on this mine, in which details regarding it are given].—Mg. & Eng. Rec. Oct. 1916; p 96; pp 4¼*; 35c.

—*British Columbia Report of the Minister of Mines*. [On the production and mineral industry of the province].—Mg. & Eng. Rec. Oct. 1916; p 92; pp 1½; 35c.

Silver

Larson, A. G.; Lakes, Arthur, Jr.—*Slocan Star Mine, British Columbia*. [Abstract of a report made by the authors on this mine, in which details regarding it are given].—Mg. & Eng. Rec. Oct. 1916; p 96; pp 4¼*; 35c.

Scott, W. A.—*The Tonopah Extension Mines in Nevada*.—Mg. World Nov. 11 1916; p 831; pp 1; 10c.

Silver Milling, Metallurgy, Etc.

See Mill and Milling, Metallurgy, Chemistry, Assaying, Etc.

Zinc

Larson, A. G.; Lakes, Arthur, Jr.—*Slocan Star Mine, British Columbia*. [Abstract of a report made by the authors on this mine, in which details regarding it are given].—Mg. & Eng. Rec. Oct. 1916; p 96; pp 4¼*; 35c.

—*British Columbia Report of the Minister of Mines*. [On the production

and mineral industry of the province].—*Mg. & Engg. Rec.* Oct. 1916; p 92; pp 1½; 35c.

— *Triplex Pumps in the Wisconsin Zinc Mines.*—*Mg. World* Nov. 11 1916; p 829; pp 1*; 10c.

(II) NON-METALS

(A) FUELS

Coal Fields and Mining

Drakeley, T. J.—*The Examination of Coal and Coke.* [Deals with methods for determining the sulphur in coal].—*Sci. & Art of Mg.* Nov. 4 1916; p 148; p 2; 35c.

Walker, Sydney F.—*Coal-Face Conveyors Employed in the United Kingdom.* [The conveying belt, shaking trough, traveling trough and the troughless chain conveyor are all described].—*Coal Age* Nov. 11 1916; p 790; pp 4¾*; 20c.

— *British Columbia Report of the Minister of Mines.* [On the production and mineral industry of the province].—*Mg. & Engg. Rec.* Oct. 1916; p 92; pp 1½; 35c.

— *Pretoria Inspectorate of Mines, 1915 Annual Report.*—*S. Afr. Mg. Jnl.* Oct. 7 1916; p 122; pp 1; 35c.

— *Rhodesia Chamber of Mines Report of the Executive Committee.* [Tables of details on the production of gold and asbestos properties in the district are given].—*Rhodesia Chamber of Mines Report* Aug. 1916; pp 6.

Petroleum

Forbes-Leslie, William.—*The Norfolk Oil Shales.* [A paper read before the Inst. of Petroleum Technologists, England. In England and Scotland oil is found mostly in these shales and similar formation].—*Petro. World* Nov. 1916; p 525; pp 5; 35c.

Murphy, S. J.—*A Submarine Pipe Line Across the Atlantic.* [A scheme for the under-sea transportation of oil and similar liquids].—*Petro. World* Nov. 1916; p 530; pp 2½*; 35c.

— *Oil in the European War Zone.* [An account of the industry in the several belligerent nations].—*Petro. World* Nov. 1916; p 520; pp 2¾; 35c.

(B) STRUCTURALS AND CERAMICS

Clays, Ceramics

Harger, F. D.—*Gas Analysis Applied to Brick Kilns.* [With the results of analysis and tests, utilization of waste heat and kiln economy are dealt with].—*B. & C. Rec.* Nov. 7 1916; p 803; pp 3; 35c.

Huac, A. J.—*Cost Accounting for the Clay Plant.* [A complete system in the form of a series. Accounting forms and description are given].—*B. & C. Rec.* Nov. 7 1916; p 806; pp 2*; 35c.

Libman, Earl E.—*Kiln Arches.* [Theory, discussion and formulas for figuring the properties and design of kiln arches].—*B. & C. Rec.* Nov. 7 1916; p 798; pp 4½*; 35c.

Concrete

Lasier, E. L.—*The Strength of Clamped Splices in Concrete Reinforcement Bars.* [Abstract of a paper read before the Am. Soc. of Testing Materials. Curves and the results and nature of tests are described].—*Canadian Eng.* Nov. 9 1916; p 373; pp 2¾*; 35c.

Stone

Schultz, J. E. M.—*Central Air Plant at a Georgia Quarry.* [The quarry, compressor plant and equipment are de-

scribed].—*Mine & Quarry* Oct. 1916; p 924; pp 5*; 20c.

(C) OTHER NON-METALS

Asbestos

Frood, G. E. B.—*The Cape Asbestos Industry, South Africa.* [From the annual report of the Government Mining Engineer. The deposits and working of the same in Cape province are described in detail].—*S. Afr. Mg. Jnl.* Sept. 30 1916; p 94; pp 1½; Oct. 7; p 127; pp 1½; 70c.

Taber, Stephen.—*The Genesis of Asbestos and Asbestiform Minerals.* [Includes an account of asbestos and minerals related to it].—*Bull. A. I. M. E.* Nov. 1916; p 1973; pp 26*; 35c.

— *Rhodesia Chamber of Mines Report of the Executive Committee.* [Tables of details of the production of gold and asbestos properties in the district are given].—*Rhodesia Chamber of Mines Report* Aug. 1916; pp 6.

Feldspar

Nenmann, B.; Draibach, F.—*Decomposition of Feldspar for the Production of Potassium Salts.*—*Zts. Angew. Chem.* Vol. 29, 1916; pp 13; \$1.

Gems

— *Transvaal Chamber of Mines Report for 1915.* [A general account of the mineral industry in the state].—*Transvaal Chamber of Mines Report.*

Graphite

Jones, Robert W.—*Graphite Industry in New York.* [Notes on the equipment, plants, mines and mineral found in the state].—*E. & M. J.* Oct. 28 1916; p 773; pp 2½*; 25c.

Mica

Schaller, Waldemar T.—*Mica in 1915.* [Production by countries for the world with notes on the occurrence of the mineral].—*Min. Res. of U. S.* 11:21; pp 14.

Potash

Grasty, John S.—*Southern Iron Ores As a Source of Potash.* [Reprinted from the *Manufacturers' Record*].—*Chem. Eng. & Mfg.* Oct. 1916; p 184; pp 2¼; 30c.

Pyrites

Drakeley, T. J.—*Iron Pyrites and the Oxidation of Coal.* [From the *Jnl. of the Chem. Soc.*].—*Coll'y. Guard.* Oct. 20 1916; p. 762; pp 1¾*; 35c.

Quartz

McDowell, J. Spotts.—*A Study of the Silica Refractories.* [Published by permission of the Massachusetts Inst. of Tech.].—*Bull. A. I. M. E.* Nov. 1916; p 1999; pp 57*; 35c.

Sulphur

Drakeley, T. J.—*The Examination of Coal and Coke.* [Deals with methods for determining the sulphur in coal].—*Sci. & Art. of Mg.* Nov. 4 1916; p 148; pp 2; 35c.

III. TECHNOLOGY

MINES AND MINING

Prospecting

Frood, G. E. B.—*The Cape Asbestos Industry, South Africa.* [From the annual report of the Government Mining Engineer. The deposits and working of the same in Cape province are described in detail].—*S. Afr. Mg. Jnl.* Sept. 30 1916; p 91; pp 1½; Oct. 7; p 127; pp 1½; 70c.

Lang, Herbert.—*The Prospectors' Field-Work.* [A general talk].—*M. & S. P.* Nov. 11 1916; p 705; pp 1½; 20c.

Drilling and Boring

Ayer, Frank.—*Reducing Air-Drill Repair Costs.* [A general talk pointing out various ways by which this cost can be reduced].—*E. & M. J.* Nov. 11 1916; p 864; pp 2*; 25c.

Dixon, C. Y.—*Plant and Method of Dry Excavation, Livingstone Channel, Detroit River, Michigan.* [From Professional Memoirs. Pumping, drilling, costs, equipment used, etc., are included in this review].—*Engg. & Cont.* Nov. 15 1916; p 425; pp 2*; 25c.

— *Method and General Cost of Rock Excavation for the Inlet Swamp Drainage District, Illinois.*—*Engg. & Cont.* Nov. 15 1916; p 429; pp ¾; 25c.

Pumps and Pumping

Dixon, C. Y.—*Plant and Method of Dry Excavation, Livingstone Channel, Detroit River, Michigan.* [From Professional Memoirs. Pumping, drilling, costs, equipment used, etc., are included in this review].—*Engg. & Cont.* Nov. 15 1916; p 425; pp 2*; 25c.

Sargeant, E. W.—*Centrifugal Pumps and Dredgers.* [Confined mostly to the use and construction of these pumps as practiced in England].—*Lippincott & Co.*; book; pp 188*; \$3.25.

— *Triplex Pumps in the Wisconsin Zinc Mines.*—*Mg. World* Nov. 11 1916; p 829; pp 1*; 10c.

Dredging

Sargeant, E. W.—*Centrifugal Pumps and Dredgers.* [Confined mostly to the use and construction of these pumps as practiced in England].—*Lippincott & Co.*; book; pp 188*; \$3.25.

Sibley, Robert.—*The Most Powerful Dredge Afloat.* [The dredge is in California and is electrically operated].—*Jnl. of Elect., Power & Gas* Nov. 11 1916; p 371; pp 3¼*; 35c.

— *Method and General Cost of Rock Excavation for the Inlet Swamp Drainage District, Illinois.*—*Engg. & Cont.* Nov. 15 1916; p 429; pp ¾; 25c.

Transport

Clapp, W. Howard.—*Economics and Costs of Motor Truck Operation.* [A paper read before the Amer. Soc. of Mech. Eng. The costs of trucks and various details in the cost of their operation is given].—*Canadian Eng.* Nov. 9 1916; p 383; pp 3¾*; 35c.

Murphy, S. J.—*A Submarine Pipe Line Across the Atlantic.* [A scheme for the under-sea transportation of oil and similar liquids].—*Petro. World* Nov. 1916; p 530; pp 2½*; 35c.

Rickard, T. A.—*The Britannia Mine and Mill, British Columbia.* [Details on the mill equipment and operation, with further information on the mine workings and deposits].—*M. & S. P.* Nov. 11 1916; p 693; pp 8*; 20c.

Warden Stevens, F. J.—*Coaling at the Panama Canal.* [Describes coaling docks and methods of operation there].—*Coll'y. Guard.* Oct. 20 1916; p 745; pp 3*; 35c.

Haulage and Conveying

Buck, A. M.—*Some Graphical Solutions of Electric Railway Problems.* [Formulas, description and curves on various problems].—*Univ. of Ill. Bull.* July 21 1916; pp 30*.

Hood, O. P.—*Safety in Hoisting and*

Slope Haulage. [Published by permission of the U. S. Bureau of Mines. A talk and discussion on preventives and accidents which have occurred].—Mg. World Nov. 11 1916; p 823; pp 1¼; 10c.

Scott, W. A.—*The Tonopah Extension Mines in Nevada.*—Mg. World Nov. 11 1916; p 831; pp 1; 10c.

Rickard, T. A.—*The Britannia Mine and Mill, British Columbia.* [Details on the mill equipment and operation, with further information on the mine workings and deposits].—M. & S. P. Nov. 11 1916; p 693; pp 8*; 20c.

Walker, Sydney F.—*Coal-Face Conveyors Employed in the United Kingdom.* [The conveying belt, shaking trough, traveling trough and the troughless chain conveyor are all described].—Coal Age Nov. 11 1916; p 790; pp 4¾*; 20c.

Sanitation

Bain, Foster H.—*Labor Problems in African Mines.* [Treats on the question of working and living conditions, with respect to sanitation].—Mg. Mag. Oct. 1916; p 199; pp 10; 50c.

Hydraulicking

— *Placer Mining in Yukon, Methods and Costs of.* [Extract of a report published by the Minister of Interior, Ottawa, Ont.].—Canadian Mg. Jnl. Nov. 1 1916; p 506; pp 3¾; 35c.

Mine Sampling

Parr, S. W.—*Chemical Study of Illinois Coals.* [Methods of sampling in the field and laboratory are given, with a review of the results of analyses].—Ill. Geol. Surv. Bull. 3; pp 86*.

Ventilation

Rosback, E. J.—*Tunnel Construction on the Mill Creek River.* [Methods of operating, drilling, compressed air equipment, lining with concrete and brick, etc., are among things described].—Mine & Quarry Oct. 1916; p 907; pp 11*; 20c.

Accidents

— *Mines Inspector's Reports for 1915.* [A report of accidents, operations and labor conditions at mines in Great Britain, being confined mostly to coal].—I. & C. Tr. Rev. Oct. 20 1916; p 483; pp 3; 35c.

Rescue and First-Aid

— *Progress of First-Aid Work in British Columbia.* [Considerable of the information is from a report to the B. C. Dept. of Mines by Dudley Mitchell].—E. & M. J. Nov. 4 1916; p 815; pp 1¼; 25c.

Safety

Hood, O. P.—*Safety in Hoisting and Slope Haulage.* [Published by permission of the U. S. Bureau of Mines. A talk and discussion on preventives and accidents which have occurred].—Mg. World Nov. 11 1916; p 823; pp 1¼; 10c.

— *Jos. A. Holmes Safety Association, Who's Who in.*—Mg. World Nov. 4 1916; p 795; pp 2¾*; 10c.

Production

Hoffman, E. J.—*The Nitration of Toluene.* [On the formation of nitrates of toluene of different valences from toluene as a byproduct from water gas].—U. S. Bur. of Mines Tech. Paper 146; pp 31; 15c.

— *British Columbia Report of the Minister of Mines.* [On the production and mineral industry of the provinces].—Mg. & Engg. Rec. Oct. 1916; p 92; pp 1½; 35c.

— *Pretoria Inspectorate of Mines, 1915 Annual Report.*—S. Afr. Mg. Jnl. Oct. 7 1916; p 122; pp 1; 35c.

— *Rhodesia Chamber of Mines Report of the Executive Committee.* [Tables of details of the production of gold and asbestos properties in the district are given].—Rhodesia Chamber of Mines Report Aug. 1916; pp 6.

— *Transvaal Chamber of Mines August Analysis of Gold Production.* [Tonnage, yield, working costs, profits, dividends, etc., are given separately in tabulated form for each company].—Transvaal Chamber of Mines Aug. Report; pp 6.

Mining Costs

Ayer, Frank.—*Reducing Air-Drill Repair Costs.* [A general talk pointing out various ways by which this cost can be reduced].—E. & M. J. Nov. 11 1916; p 864; pp 2*; 25c.

Clapp, W. Howard.—*Economics and Costs of Motor Truck Operation.* [A paper read before the Amer. Soc. of Mech. Eng. The costs of trucks and various details in the cost of their operation is given].—Canadian Eng. Nov. 9 1916; p 383; pp 3¾*; 35c.

Dixon, C. Y.—*Plant and Method of Dry Excavation, Livingstone Channel, Detroit River, Michigan.* [From Professional Memoirs. Pumping, drilling, costs, equipment used, etc., are included in this review].—Engg. & Cont. Nov. 15 1916; p 425; pp 2*; 25c.

Larson, A. G.; Lakes, Arthur, Jr.—*Sloan Star Mine, British Columbia.* [Abstract of a report made by the authors on this mine, in which details regarding it are given].—Mg. & Engg. Rec. Oct. 1916; p 96; pp 4¾*; 35c.

— *Method and General Cost of Rock Excavation for the Inlet Swamp Drainage District, Illinois.*—Engg. & Cont. Nov. 15 1916; p 429; pp ¾; 25c.

— *Transvaal Chamber of Mines August Analysis of Gold Production.* [Tonnage, yield, working costs, profits, dividends, etc., are given separately in tabulated form for each company].—Transvaal Chamber of Mines Aug. Report; pp 6.

Accounts and Bookkeeping

Huac, A. J.—*Cost Accounting for the Clay Plant.* [A complete system in the form of a series. Accounting forms and description are given].—B. & C. Rec. Nov. 7 1916; p 806; pp 2*; 35c.

Mining Miscellany

Jackman, A. N.—*Russian Mines.* [A handbook of mining concessions worked by British interests in Siberia].—Financial Times, London; book; 50c.

MILLS AND MILLING

Crushing, Grinding, Etc.

Gahl, Rudolph.—*Operations and Methods in Use at the Inspiration Property, Arizona.* [A flow sheet of the mill, with considerable statistical data on the distribution of power, milling and flotation work].—Mg. World Nov. 11 1916; p 825; pp 3*; 10c.

Merrill, F. J. H.—*Recent Ball Mill Types for Grinding Ores.* [Detailed description of Hardinge and Marcy ball-mills].—Mg. & Oil Bull. Nov. 1916; p 273; pp 2½*; 25c.

Rickard, T. A.—*The Britannia Mine and Mill, British Columbia.* [Details on the mill equipment and operation, with

further information on the mine workings and deposits].—M. & S. P. Nov. 11 1916; p 693; pp 8*; 20c.

Flotation

Clayton, Charles Y.—*Sizing Flotation Concentrates.* [Abstract from an article in the Bulletin of the Missouri School of Mines, in which the results of tests made are given and discussed].—E. & M. J. Nov. 11 1916; p 867; pp ¾; 25c.

Gahl, Rudolph.—*Operations and Methods in Use at the Inspiration Property, Arizona.* [A flow sheet of the mill, with considerable statistical data on the distribution of power, milling and flotation work].—Mg. World Nov. 11 1916; p 825; pp 3*; 10c.

Stander, H. J.—*Alaska Has One Up-to-Date Flotation Plant—the Kennecott.* [A description of the plant and the results which have been obtained].—Mg. World Nov. 11 1916; p 822; pp 1¼; 10c.

Stander, H. J.—*The Flotation Process.* [A text with subjects in logical sequence for the student and others. Various methods are described in detail, methods of testing, costs, practice, etc., are dealt with separately].—Mining World Co.; book; pp 175*; \$3.

Concentration: Sorting, Sizing, Washing

Deshler, George O.—*Ohio Copper Concentrator, Utah.* [A description of the flow of the ores and the slime plant and method for water recovery].—E. & M. J. Nov. 11 1916; p 855; pp 1*; 25c.

Gahl, Rudolph.—*Operations and Methods in Use at the Inspiration Property, Arizona.* [A flow sheet of the mill, with considerable statistical data on the distribution of power, milling and flotation work].—Mg. World Nov. 11 1916; p 825; pp 3*; 10c.

Rickard, T. A.—*The Britannia Mine and Mill, British Columbia.* [Details on the mill equipment and operation, with further information on the mine workings and deposits].—M. & S. P. Nov. 11 1916; p 693; pp 8*; 20c.

Scott, W. A.—*The Tonopah Extension Mines in Nevada.*—Mg. World Nov. 11 1916; p 831; pp 1; 10c.

Chlorination

Neal, Walter.—*The Manganese and Silver Problem.* [Notes on investigations made to find a satisfactory method for treating silver-manganese ores. — Jnl. Chem. Met. & Mg. Soc. Aug. 1916; p 9; pp 9½; 35c.

Mill and Smelter Costs

Foote, Frederick W.—*Estimating Construction Costs.* [The present status of estimating, with examples from practice based on the ratio of labor and materials entering into the work].—E. & M. J. Nov. 11 1916; p 857; pp 3¼; 25c

Stander, H. J.—*The Flotation Process.* [A text with subjects in logical sequence for the student and others. Various methods are described in detail, methods of testing, costs, practice, etc., are dealt with separately].—Mining World Co.; book; pp 175*; \$3.

CHEMISTRY AND ASSAYING

Chemistry

Drakeley, T. J.—*The Examination of Coal and Coke.* [Deals with methods for determining the sulphur in coal].—Sci. & Art. of Mg. Nov. 4 1916; p 148; pp 2*; 35c.

Hoffman, E. J.—*The Nitration of Toluene*. [On the formation of nitrates of toluene of different valences from toluene as a byproduct from water gas].—U. S. Bur. of Mines Tech. Paper 146; pp 31; 15c.

Assaying

Scott, W. A.—*The Tonopah Extension Mines in Nevada*.—Mg. World Nov. 11 1916; p 831; pp 1; 10c.

Analysis

Drakeley, T. J.—*The Examination of Coal and Coke*. [Deals with methods for determining the sulphur in coal].—Sci. & Art of Mg. Nov. 4 1916; p 148; pp 2; 35c.

Harger, F. D.—*Gas Analysis Applied to Brick Kilns*. [With the results of analysis and tests, utilization of waste heat and kiln economy are dealt with].—B. & C. Rec. Nov. 7 1916; p 803; pp 3; 35c.

METALLURGY

Electrochemistry

Heath, George L.—*The Analysis of Copper and Its Ores and Alloys*. [Methods of analysis and assay for different products containing copper].—McGraw-Hill; book; pp 292*; \$3.

Electrometallurgy

Antisell, F. L.; Skowronski, S.—*Electrolytic Copper Refining*. [Abstract of a paper read before the Amer. Inst. of Metals. The process is described from the melting of blister copper into anodes to the thermic refining of the cathodes resulting from electrolysis].—E. & M. J. Nov. 11 1916; p 874; pp 2¼; 25c.

Stander, H. J.—*The Flotation Process*. [A text with subjects in logical sequence for the student and others. Various methods are described in detail, methods of testing, costs, practice, etc., are dealt with separately].—Mining World Co.; book; pp 175*; \$3.

Thermic Metallurgy

Antisell, F. L.; Skowronski, S.—*Electrolytic Copper Refining*. [Abstract of a paper read before the Amer. Inst. of Metals. The process is described from the melting of blister copper into anodes to the thermic refining of the cathodes resulting from electrolysis].—E. & M. J. Nov. 11 1916; p 874; pp 2¼; 25c.

Metallurgy General

Fulton, Charles H.—*The Buying and Selling of Ores and Metallurgical Products*. [Methods of sampling and the different ways in which ores are settled for and penalized are explained].—U. S. Bur. of Mines Tech. Paper 83; pp 42; 15c.

POWER AND MACHINERY

Electricity

Buck, A. M.—*Some Graphical Solutions of Electric Railway Problems*. [Formulas, description and curves on various problems].—Univ. of Ill. Bull. July 21 1916; pp 36*.

Gahl, Rudolph.—*Operations and Methods in Use at the Inspiration Property, Arizona*. [A flow sheet of the mill, with considerable statistical data on the distribution of power, milling and flotation work].—Mg. World Nov. 11 1916; p 825; pp 3*; 10c.

Murphy, S. J.—*A Submarine Pipe Line Across the Atlantic*. [A scheme for the under-sea transportation of oil and similar liquids].—Petro. World Nov. 1916; p 530; pp 2½*; 35c.

Sibley, Robert.—*The Most Powerful Dredge Afloat*. [The dredge is in California and is electrically operated].—Jnl. of Elect., Power & Gas Nov. 11 1916; p 371; pp 3¼*; 35c.

Compressed Air

Ayer, Frank.—*Reducing Air-Drill Repair Costs*. [A general talk pointing out various ways by which this cost can be reduced].—E. & M. J. Nov. 11 1916; p 864; pp 2*; 25c.

Dixon, C. Y.—*Plant and Method of Dry Excavation, Livingstone Channel, Detroit River, Michigan*. [From Professional Memoirs. Pumping, drilling, costs, equipment used, etc., are included in this review].—Engg. & Cont. Nov. 15 1916; p 425; pp 2*; 25c.

Combustion Engines

Clapp, W. Howard.—*Economics and Costs of Motor Truck Operation*. [A paper read before the Amer. Soc. of Mech. Eng. The costs of trucks and various details in the cost of their operation is given].—Canadian Eng. Nov. 9 1916; p 383; pp 3¼*; 35c.

Smith, P. H.; Primrose, H.—*Cylinder Liner Wear and Remarks on Piston Seizures*. [The information is on Diesel and other types of internal-combustion engines].—Petro. World Nov. 1916; p 540; pp 5*; 35c.

Wilkins, F. Trevor.—*Diesel Engine Trials*. [A paper read before the Inst. of Mech. Eng., England. Details of tests of various kinds are given].—Engg. Oct. 27 1916; p 422; pp 4*; 35c.

Steam and Steam Engines

Year	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—For the first time in the history of the copper trade the red metal has sold above 30 cts. on deliveries to be made a year in the future. Other records have also been established. Spot copper has sold at 31 3/4 cts., December electrolytic sold at 34 1/2 cts., first quarter at 33 to 33 1/2 cts., second quarter at 32 1/2 cts., and third quarter at 31 1/2 cts., while for the fourth quarter of next year business has been done at 30 to 30 1/4 cts. The extent of the forward business in copper is alone sufficient to furnish an index as to the trend of affairs but in addition the heavy buying of the red metal for nearby deliveries creates an unparalleled situation. Business since our last report has been on an active scale. Buying for delivery this year as well as over the first half of next year did not abate. Consumers who were thought to be protected for this period came into the market and took sizable blocks of the metal. Melters who underestimated their requirements or were dilatory in covering were also in the market.

The tremendous business done by dealers in the past 3 weeks has led to the question arising as to where these dealers obtained the copper they are selling. In one quarter it was asserted that consumers were reselling copper they had purchased around 27 cts. and taking their profit. The fact that important as well as small consumers have been buying recently appears to eliminate this suggestion from consideration. Another report, one that created amusement, was that the Entente Allies were reselling copper they had purchased in the block of 448,000,000 lbs. and for which they paid around 25 cts. Producers who were concerned in this sale characterized this report as laughable as they would know very quickly if such were the case. They pointed out that England instead of being so well supplied with the red metal that it could turn speculator and sell what it had purchased recently under difficulties, could use several hundred million pounds more of copper in the first half if it could be obtained. The dealers who are now selling copper and are obtaining the high prices, were steady buyers of the metal when prices were low. They foresaw the coming of the day when full realization would come that production was not equal to consumption, and they prepared for that day. There has been no reselling of copper by consumers, either domestic or foreign.

Business since our last report has amounted to fully 275,000,000 lbs., the bulk of this tonnage being sold by dealers

for first and second quarter delivery. It has become known that the steamer *Rowanmore* which was sunk by a German submarine had 1000 tons of copper aboard. In these days of copper shortages the loss of this amount of metal is very serious. October production is estimated at 172,000,000 lbs., but some producers expected that November will show a yield close to 180,000,000 lbs.

Prices are difficult to quote, all transactions being subject to individual negotiation. Thus while one sale for the first quarter may be made at 33 3/4 cts., the next may be done at 33 1/2 cts. Striking a balance, however, first quarter metal may be quoted at 33 1/2 cts., second quarter at 32 1/2 cts., third quarter at 31 1/2 cts., and fourth quarter at 30 to 30 1/4 cts. Lake copper for the first quarter was sold at 32 3/4 to 33 cts. Spot and December casting copper is unquotable. One producer is asking 33 cts. for December casting. For January and February delivery casting has sold at 31 cts. and at 30 3/4 cts. for March. Some large sales of lake arsenical copper for first quarter delivery have been put through at 32 1/2 to 33 cts. One producer found a ready market for a large amount of off grade copper which consumers quickly took.

The London market has advanced steadily. Last week electrolytic advanced £10 to £158 with further gains this week. Standard copper advanced £14 10s. in spot and futures.

Quotations for copper per pound at New York for the week ended Nov. 22, were as follows:

(For First Quarter Delivery.)

Tin.—A scarcity of spot tin has projected itself as the dominant factor of interest in the tin market. Price advances have been steady and at some times very sharp. Spot straits tin sold up to 45½ cts., while spot Banka sold up to 41¾ cts.

Arrivals since the first of the month total only 850 tons. The *Suruga* will not make November delivery so that indications are that November imports on the Atlantic available for delivery will not total over 1200 tons. The Pacific coast will not bring in much more than 800 tons. Against this 2000 tons there is a monthly consumption of 4200 tons. English officials have withheld permits because of the excessive holdings there. The decrease in stocks will therefore result in freer granting of permission.

Quite a good business has been done in April, May and June arrivals since our last report, but beyond these months buyers were not interested. Straits tin for December delivery was quoted at 44½ cts., with January arrival held at 44¼ cts., February at 43½ cts. and March at 43½ cts. London and Singapore advanced steadily last week except for a minor recession at the close, while this week foreign markets were irregular.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Nov. 22, were as follows:

Nov. 16.....	New York		London.	Singapore,
	Spot.	December.	Straits, spot.	shipments.

November				39.375
December				38.765
Year				38.664

Lead.—It develops that leading independent producers have done a substantial business for December delivery, although information as to these transactions has been withheld. One producer reports taking sizable orders for December delivery from domestic consumers at 7.02½ cts. St. Louis, whereas up to late last week these producers asserted that their price was 6.95 cts. St. Louis. Canadian consumers have not as yet reentered the market for December metal but their advent as buyers is not far off, sellers reporting that they have been drawing heavily against their November allowances.

Business in lead for December has not as yet reached its crest. The leading interest adheres to its quotation of 7 cts. New York, and 6.92½ cts. St. Louis, but is not doing business at these prices. The leading interest is reported to be largely sold out for December and even January on open price contracts. In any event the belief is gaining ground that the official quotations will be changed to higher ones with the turn of the month. At London the market has remained dormant.

Quotations for lead per pound at New York and per ton at London for the week ended Nov. 22, were as follows:

Nov. 16.....	New York		London	
	Indpts.	A. S. & R. Co.	Spot.	Futures.

Zinc Ore.—The strength of the previous week continued during the week ended Nov. 18 and prices were up \$5. The better grades brought \$95 per ton and this price ranged down to \$85 for the poorer grades. Sales made during the week amounted to \$502,330 for 11,639,615 lbs. of concentrates. This made the total for the year 618,986,387 lbs., valued at \$24,681,113.

Calamine.—No change was noted in this market and prices remained firm at \$15 to \$50. There were 1,352,300 lbs. of concentrates valued at \$32,790 shipped during the week. The total for the year was placed at 33,105,905 lbs., valued at \$1,003,112.

MONTHLY AVERAGE PRICES OF JOPLIN ZINC ORE.

Spelter.—Buying of spelter has been on a very large scale with consumers taking metal for delivery over the second quarter as well as the first quarter. With the market ranging about 11 cts for first quarter delivery some producers entered the market as sellers but others refrained from offering, asserting that they expect to secure 13 cts.

and perhaps better for their production. The entry of some producers into the market as sellers did not at first have any repressive effect on prices but later on the freer offerings resulted in concessions from dealers. Spot prime western sold up to 12½ cts. New York, and 12¼ cts. St. Louis. Spot brass special sold at 13 cts. St. Louis, while business in higher grades than brass special was done at 13½ cts. St. Louis for spot. Prime western for the first quarter sold up to 12¼ cts. with some small lots done at 12 cts., but later on the market moved off to 11½ cts. For the second quarter business was done around 11 to 11¼ cts. Zinc sheets have been advanced twice each time one cent so that the price is now 19 cts. base. The London market advanced last week but receded this week.

Quotations for spelter per pound at New York and per ton at London for the week ended Nov. 22, were as follows:

	New York.		London

MISCELLANEOUS METALS.

Quicksilver.—Although mercurial drugs have been advanced the situation in quicksilver shows no change, sellers continuing to quote \$80 per flask. When drug makers put up their prices it was thought that quicksilver would go higher, but leading sellers state that no change will be made as yet. There is a steady demand with supplies fair to good.

Antimony.—Information as to this metal has been conflicting. Some Chinese interests contend that spot is selling at 14 cts., but other sellers put the price at 13¼ cts. and in some cases a flat 13 cts. A Canadian inquiry for December and January delivery is in the market.

Sheet Zinc.—On Friday, Nov. 17, and on Monday, Nov. 20, advances were made in the price of sheet zinc, the quotation now being 19 cts. a pound base. Thus far three advances have been announced this month, each of one cent a pound.

Pig Iron.—The upward trend of pig iron prices has not been headed, although the demand for iron is less excited. Furnaces are not quoting except on firm inquiries. Large sales of basic and bessemer have again been made while a considerable business has been done in foundry grades, Birmingham furnaces selling about 60,000 tons and northern furnaces about 45,000 tons. No. 2 iron at Buffalo is quoted at \$28 with eastern Pennsylvania furnaces asking \$27, valley furnaces \$27, Birmingham furnaces \$20 and Ohio furnaces \$26 to \$27.

Ferromanganese.—There has been no essential change in the situation, English and domestic ferromanganese being quoted at \$160 to \$165 per ton. Demand is only fair.

Nickel.—Business in this metal is fairly active with the market remaining at 45 cts. for ordinary forms and 50 cts. for electrolytic.

No. 23. Vol. 45.

CHICAGO

December 2, 1916.

Aspen, Over the Range in Pitkin County, Colorado

W. A. ROOT.

The days of the excitement and advent into the Black Hills of South Dakota and to Leadville, during 1876, and from that time on for several years, will long be remembered, and in fact, are a portion of the historical records of mining districts and mine development. About the time of the wild excitement over mineral discoveries in the Black Hills there was much seeking for gold by sluicing and other primitive methods in California gulch, the waters of which, a tributary to those of the Arkansas river, whose real source

wonderful history of that world renowned camp—Leadville—of the naming of it, nor of the enormous fortunes realized and afterward scattered broadcast over the land. The story of Leadville's remarkable days is now before the public in a neat volume by C. C. Davis, of Los Angeles, for many years a resident of Leadville.

"On to Colorado," "On to Pike's Peak or Bust," were painted or draped on the bull-whacking trains crossing the plains in 1859, and into the 60s, and so in

SMUGGLER AND MOLLIE GIBSON MINES.

INTERIOR ROARING FORK ELECTRIC PLANT, ASPEN, COLO.

were only a few miles away and near to the summit of the Continental divide.

The finding of boulders largely composed of carbonate of lead and silver while working the dirt of the bed and channel of California gulch caused the prospecting for ledges, leads or bodies of ores on the hillsides above the gulch. Among the first discoveries were those of the Galligher Bros., and the sale of their locations for something above \$100,000 was soon heralded abroad, causing the influx into the district of thousands, embracing all classes, many of whom were prospectors and miners from almost every known mining district.

It is not my purpose to enter into detail of the

the days of Leadville in 1879, upon hundreds of freight wagons and other vehicles could be seen the nearness of the old inscription, "On to Gunnison," "Gunnison or Bust," and so during that year every canyon and gulch on the eastern slope of the Rocky mountains from the headwaters of Arkansas down to the mining camp of Salida, were filled with prospectors and seekers after mineral wealth; and the same of the western slope.

The peculiar character of the earth's formation at Leadville was seemingly unknown, and caused much study of Hayden's Atlas, so much so that old-time gold seekers in granite formation left the gold-bearing sections to hunt for that of a salurian, namely, when the

ores, silver and lead-bearing, would be found in deposits forming a contact between lime, porphyry or quartzite.

The prospectors who made their way into the Roaring Fork district and discovered the Smuggler, Mollie Gibson and Della S. upon one side of the Roaring Fork river, and the Spar, Durant, Emma, Vallejo, Broadway and others on Aspen mountain, came mostly from Buena Vista over Cotton Wood pass, through Union and Taylor parks, over Elk Mountain spur, and then down Castle creek. A few did get over Independence pass at head of Lake creek above Twin lakes. In February and March, 1880, nearly every claim in the district was bonded for goodly sums to eastern men of means, and from the money expended by them and others, the big mines of the district were developed. The years from 1887 till 1892 were prolific for nearly every one who came to Aspen seeking fortunes,

HOPE LEASING CO.'S TUNNEL, ASPEN, COLO.

and undoubtedly, only for the demonitization of silver, Aspen would be a city of many thousands today. The mining men who have remained at Aspen are possessed of much abiding faith and contend that with proper underground developments millions of silver, lead and zinc values can be mined from the interior of Aspen mountains.

The Smuggler Leasing Co.

This company, with David M. Hyman of New York, president; Edwin M. Rogers of New York, vice-president and consulting engineer, and C. E. Anderson, superintendent, was organized in 1911, and at once took over the Smuggler and Durant mines, the latter on Aspen mountain; afterward leasing the Mollie Gibson, Della S., Bushwhacker, Mineral Farm, Park Regent and Argenta. The identity of the Mollie Gibson is absorbed with that of the Smuggler. The greater portion of the regular production comes from the shaft of the Della S., amounting to about 400 tons every 24 hours, while that of the few leasers is hoisted from the Smuggler. The values are in lead and silver, the former 78% and a few ounces of silver. The greatest depth of the workings are on the 18th level at 1600 ft. below the surface, with greater portion of the ore

mined on the 15th, and exploitation constantly below the 13th level to the 18th. On the 15th level are five Aldrich Queen duplex electric pumps, each of 200 hp., and on the 18th, two Aldrich electric pumps, and with the other pumps about the mine, together raise 3000 gpm., causing the drainage of a very large area. All electric power is furnished by the Roaring Fork Electric Light & Power Co.

The Wet Concentrating Plant.

The Houghton and Harding mill on the Roaring fork, in close proximity to the Smuggler mine, is equipped with a Dodge crusher, three sets of rolls, 10 sets of 4-compartment jigs of the crank arm type, originally manufactured in Germany. The motion is an accelerated one, with a quick down stroke and of a slow return, with force from the plunger. There are 7 Wilfleys and 6 Frues on primary feed, and 8 Frues and 12 Wilfleys on regrinding the tailings, making 19 Wilfleys and 14 Frues in the mill. About 90% of the 400 tons of ores treated come from the Smuggler, and the other 10% from leasers on the Durant. All machinery and electric lights are run by power from the Roaring Fork Electric Light & Power Co.

The Durant Compressor.

At the base of mountain above Aspen is situated the 80-hp. Norwalk compressor and 80-hp. boiler with a Leyner tool sharpener. At the shaft of the Durant, several hundred feet up the mountain, is a 130-hp. hoist and a 65-hp. motor. The shaft is double compartment, with the double and single deck cars working tandem. The ore is sent down to cars by aerial tram, and then hauled to the mill. The compressor furnishes air for 10 miles of underground workings in Aspen mountains, and also for the air drills in use. Chas. O. Kane is in charge.

The Roaring Fork Electric Light & Power Co.

The plant of this company is located west of the town line and is of much importance, furnishing water, light and power for everything in and about Aspen—the mountain, the mines and the mill. The reservoirs are on Castle and Hunter creeks and its pipes and flumes extend for miles.

The power plant has three 400-kw. and two 200-kw. generators, each generator having in one end of shaft a Pelton-Doble tangential water wheel, and on the other end of the shaft, a heavy cast steel flywheel of 105 ins. in diameter. The generators are direct-current machines, 600-volt, operated two in series on a 600 to 1200 volt, 3 wire system; distance of transmission is 1 to 2 miles. David R. C. Brown, for nearly 20 years connected with Aspen enterprises, is president; C. F. Brown is secretary and C. E. Doolittle, manager.

Hope Mining, Milling & Leasing Co.

One of the greatest of propositions put forth in the Roaring Fork mining district, and with many good

signs of ultimate success, was the organization of the Hope Mining, Milling & Leasing Co. Its principal stockholders are residents of the Roaring Fork valley, and no salary or compensation is paid to any officer or director acting in official capacity. Besides the ownership of four full claims, several fractions and a mill site, it has secured a lease on the Little Annie and other propositions, controlling an area of 400 acres. Equipment consists of a compressor plant consisting of an 80-hp. boiler, a 4-drill air compressor, blacksmith shop and a ventilating plant, the power for which is obtained from utilizing the water flowing from the Famous tunnel. The physical condition of the property improves with the advancement of the tunnel toward the vein of the Little Annie mine, the reaching of which is the object of driving the tunnel. The tunnel known as the Famous is in about 6000 ft., and will cut the vein at about 1100 ft. further in. In

MOLLIE GIBSON'S SILVER NUGGET, WEIGHING 1840 LBS.

driving the tunnel, ore of high grade has been met with.

The Little Annie mine is expected to be the great proposition of the Hope Co., especially when the Famous tunnel reaches the vein at a point 1500 ft. below the surface. The property is located on the Castle creek fault, and its workings are in porphyry and shale on the west side of the fault, and it also crosses the fault into silurian-dolomite. On the lower levels the ore is a sulphide of lead, zinc and silver, with a considerable amount of barite. The galena is sometimes beautifully crystallized, and the silver is often found native. The first section of 250 ft. in the 2250 ft. on the dip produced more than \$7,000,000, and if the future undertakings of the present organization prove successful, the production will reach millions more in silver, lead, zinc, and probably much copper.

The officials of the company are Charles O'Kane, president; H. W. Clark, secretary, and J. B. Stitzer, treasurer.

The West Contact.

It can be surmised that two contacts exist in general formation of the Roaring Fork mining district, and that they are separated by several hundred feet

of short lime. All these properties owned by and under lease to the Smuggler Leasing Co. are in the eastern contact, while the west contact takes in the Copperopolis, Jute Smith, Ducey and Monarch claims. Passing south there are the Great Pacific, Keystone, Mayflower, Saddle Rock group, and still further south occur the Morning and Evening Star, New York and Queens Gulch group. A tunnel driven 1200 ft. along the contact from this group opens up rich bodies of ore. The objective point of this tunnel is to reach ore bodies of the Midnight and other claims. Development for a distance of 3 miles or more shows there is an east and west contact of the ore zone of the district. The values are mostly silver-lead, while part of the west contact produces considerable zinc. The Saddle Rock, Jute Smith and Copperopolis group, under management of Capt. Geo. W. Thatcher, with \$150,000 expended in development, produced ore shipments to the amount of \$500,000. He asserts from developments of the next 2 years the product will amount in value to a far greater sum.

Exports of Non-Ferrous Metals.

Exports of non-ferrous metals for 8 months ended in August were \$412,140,072 in 1916, against \$136,397,922 in 1915, and \$105,386,742 in 1914. The average rate of export in 8 months of 1916 has been four times corresponding figures of 1914, a representative year just before the war. Brass and brass manufactures were \$203,097,551 in 8 months of 1916, or eight times the figures of 1914.

Exports of copper group in 1916 have increased in value 64% over corresponding figures of 1914. Zinc and zinc manufactures exports were more than 50 times figures for 1914, and aluminum and manufactures nearly 10 times. Exports of 6 principal non-ferrous metals compare for 8 months ended August:

	1916.	1915.	1914.
Brass and manufactures...	\$203,097,551	\$ 26,602,575	\$ 4,559,204
Copper and manufactures...	148,163,887	74,344,509	89,713,158
Zinc	36,172,790	18,270,512	698,512
Lead and manufactures...	10,701,465	6,865,305	3,524,337
Nickel and manufactures...	7,817,061	7,635,651	6,249,378
Aluminum and manufactures	6,187,318	2,678,770	642,153
Total	\$412,140,072	\$136,397,922	\$105,386,742

Average export prices show considerable differences in degree of inflation. Average export price of copper for 8 months of 1916 was 26 cts., and for same periods of 1915 16 cts., and of 1914 14 cts. Prices of brass bars as averaged were 29 cts. in 1916, 17 in 1915, and 14 in 1914. Figures for nickel were 39 cts., 38 and 32 for 1916, 1915 and 1914. Lead average prices were 6.7 cts. for 1916, 4.3 cts. in 1915 and 3.9 in 1914. Average advance in prices for first 8 months of 1916 over 1914 comparison for copper, brass, nickel and lead was 72%.

By a special process of annealing, toughness and malleability may be developed to a remarkable degree in white cast iron. In this way castings are made to answer for forgings in many cases.

Sulphidizing Carbonate Tailings for Treatment by Oil Flotation

W. A. SCOTT.

The Prince Con. Mining & Smelting Co. has begun the operation of a plant at the old site of Bullionville, 2 miles west of Panaca, Nev., for the treatment of 120,000 tons of mill tailings. About 70,000 tons are deposited on the flat at Bullionville, and 50,000 tons are in Dry valley, 12 miles to the northwest. These tailings resulted from operations of mills on Pioche ores 35 to 40 years ago. These old milling points are on the edge of Meadow Valley wash, where water for mill work was easily obtained. The tailings are silicious and thoroughly oxidized. It is stated they have an average content of 8.2% lead, 11 ozs. silver and \$1.40 gold. The lead is in the form of carbonate, the silver as a chloride. The original treatment was by concentration and pan-amalgamation, and a part of them have since been re-treated by cyanidation.

The new mill, which consists of new equipment in an old building, was designed by C. F. Sherwood, metallurgical engineer, Salt Lake. It is equipped for concentration by flotation machines, with table concentration as accessory thereto. In order to make oil flotation effective on carbonate ores, a method was adopted for sulphidizing the lead carbonates with sodium sulphide, giving the mineral particle an exterior film of sulphide.

A considerable portion of the tailings at Bullionville has an overburden of material deposited by flood waters. This has to be removed by scrapers. The mineralized tailings are moved by scrapers and dumped into a hopper-bottomed bin, and thence loaded into ore cars, and hauled by a 40-hp. gasoline winding engine to a 200-ton bin at the head of the mill. It passes from this bin to a 5 by 18-ft. Denver Engineering Works tube mill, which serves to reduce the pulp's original mesh to some degree but principally to break up and polish the surfaces of the mineral particles. The tube product passes to a Dorr thickener, and thence to two mechanical agitators, and during the agitating process a solution of sulphide of sodium is drawn into and mixed with the pulp. The sulphidizing of the mineral particles requires 30 to 40 minutes. The pulp is now ready for emulsifying and flotation. It is discharged from the agitators to the boot of an elevator, and is raised and discharged into two Pachuca tanks, each 4 by 18½ ft. In these tanks the pulp and flotation oils are thoroughly mixed by air lifts, after which the mixture passes to six Callow roughing cells. This rougher product is re-treated in two Callow cleaner cells. The tailings from the roughing cells go to a Dorr classifier, the overflow from which is returned to a small Pachuca tank in which more oil is added, and the mixture re-treated by flotation. The sand from

Dorr classifier is passed over four concentrating tables of Deister Machine Co. The table middlings are returned to the head of the mill circulation; the tailings go to the waste dump and the concentrates, after being passed through a Dorr thickener, are further de-watered by an Oliver filter. The concentrates from the cleaner cells are likewise reduced as to moisture by an Oliver filter, and the cleaner cell tailings are returned to Pachuca tanks. It is expected that the mill soon will be treating 200 tons per day.

The source of power is a vertical, 3-cylinder, 150-hp. gas engine of Fairbanks-Morse make, using "tops" as fuel. The engine power is transmitted by a belt drive to a 100-kw. Westinghouse 440-volt generator, supplying power to motors throughout the mill for driving the machinery. This includes a blower for the flotation machines, an air-compressor for starting the engine and to supply air for Pachuca tanks. A water tank above the mill is filled by means of a pipe line from springs on the flat, where an electric-driven centrifugal pump is operated.

The sulphide of sodium is received in metal drums, in fused state, and is readily dissolved in water in a small tube mill. The flotation oils comprise coal tar, coal tar creosote and Pensacola Tar & Turpentine Co.'s tar oil, and Naval Stores Co. oil. Murray C. Godbe, Salt Lake, general manager of the company, has general direction of the operations. F. H. Franklin is mill superintendent, with F. S. Shepherd in charge of the flotation work.

These operations are separate and apart from the extensive mining operations of the same company at Pioche, where the Prince Con. mine is producing 300 to 400 tons of ore per day, which is shipped direct to the Salt Lake valley smelters.

Gold Output on the Rand.

The Rand gold output in October was 792,000 fine ounces, comparing as follows:

	1916.	1915.	1914.	1913.
January	787,000	714,984	651,000	789,390
February	753,000	476,000	626,000	734,122
March	796,000	753,000	686,000	790,000
April	754,000	744,000	684,000	784,000
May	777,000	763,000	720,000	794,000
June	761,000	755,000	717,000	547,000
July	761,000	710,000	732,000	655,000
August	781,000	778,000	711,000	728,000
September	771,000	776,000	702,000	706,000
October	792,000	797,000	733,000	718,000
November	781,000	715,000	673,000
December	781,000	672,000	776,400
Total	8,888,984	8,580,512	9,124,296

Too often elevators are run until they break, and to this practice the troubles experienced with elevators are generally to be attributed.

Flotation of Gold and Copper Ores at Mount Morgan Mine, Queensland

W. SHELLSHEAR.*

Notes on Different Oils Used.

Eucalyptus.—Laboratory tests, backed up by large-scale ones, clearly indicated that, of the eucalyptus oils used, those of the types containing phellandrene gave better results than those of other types which did not contain phellandrene. Various tests were made on this point.

Eucalyptus distilled off local plants of the type *Eucalyptus citriodora* and oil distilled from box were tried, but results were not as good as from oils of the phellandrene type just mentioned.

Addition of Oil.—In the large-scale plant it was found that the flotation was influenced by an excess of oil almost as much as by too little oil. It was sensitive in this respect, as too much oil caused a heavy float in the residue launder. In the small-scale laboratory machine, of the ordinary spitz-box type, this was not found to be the case. Experiments on the large scale, adding oil continuously for a long period on the dry feed in the Challenge feeders, proved that the percentage of insoluble in the concentrates did not increase above normal. Experiments were also made to determine the effect of oil in varying quantities to the different agitators. The best results were obtained by adding oil partly in No. 1 and partly in either No. 2 or No. 3 boxes. Many oils were tried in the laboratory, but the writer confines himself to two.

Oleic Acid, in flotation without acid, is interesting in its action, as it floats everything; in fact, so great is its tendency to pick up sand, that a mixture of 5% oleic acid and 95% eucalyptus gave a concentrate with over 50% insoluble.

Residuum Oil.—Although the results obtained by residuum oil alone were only moderate in the laboratory and bad on the large-scale plant, residuum-eucalyptus mixture proved very successful.

In order to compare results obtained in the laboratory with those from actual large-scale experiments, tests are given in each case. In connection with this matter, it is of importance to mention that the eucalyptus which is used must be of a good quality, as a poor brand of eucalyptus cannot be made to give good results by blending it with residuum oil.

A Comparative Laboratory Test of Eucalyptus and Eucalyptus-Residuum Mixtures.

Samples were crushed through 50-mesh screens in large plant, and treatment conditions were kept as nearly as possible identical in each case. Laboratory tests, therefore, indicated that an equal weight of

mixed oil gave higher recoveries in gold and copper and a reduction in cost of oil, as eucalyptus cost 20 cts. per lb. and residuum 2½ cts. per lb., but the concentrates were higher in insoluble.

The following tests were carried out on the large scale in the experimental plant, the tests averaging about 5 to 6 hours each: Mixtures of two parts eucalyptus to one part residuum, one part eucalyptus to one part residuum, up to one part eucalyptus to four parts residuum, were successfully used. For a considerable period eucalyptus and residuum mixtures only were used. The oil cost during this period was reduced from 18 to 10 cts. approximately per ton of crude ore treated. All tests were carried out under identical conditions, the feed being 15 tons per hour in each case and dilutions 3 to 1. Tests were daily runs in large-scale plant.

The tests proved that eucalyptus-residuum mixtures gave as good results as eucalyptus, with a saving in the cost of oil. Observations during the runs indicated that oil conditions were not so sensitive with the mixed oils as with eucalyptus. Results were not quite so good on the large scale with eucalyptus-residuum mixtures as in laboratory tests. This was probably due to the time factor, as the time of treatment was less in the large scale plant. This also may account for the fact that the silica in the concentrate was lower in large-scale tests.

The following are assays of each flotation box using a mixture of one part eucalyptus to three parts residuum:

	Gold. dwt.	Copper. %	Silica. %
No. 1 box concentrate.....	39.01	16.08	7.91
No. 2 box concentrate.....	33.47	14.72	10.56
No. 3 box concentrate.....	35.92	15.72	11.40
No. 4 box concentrate.....	32.66	15.64	13.72
No. 5 box concentrate.....	13.38	6.07	32.60
No. 6 box concentrate.....	6.19	2.08	69.56

No. 6 box was returned. Sand floated in Nos. 5 and 6 boxes.

Method Adopted in Large-Scale Concentration Plant.

Although in some cases very little extra gold was recovered by vanning and flotation tests as compared with straight flotation tests, in most cases the extra recovery obtained was appreciable, and this fact was really the main one in considering the erection of tables before flotation in the large treatment plant.

Other advantages were:

(a) Recovery of a large proportion of coarse iron concentrates, which, when mixed with finely ground flotation concentrates, would give a product easy to handle.

(b) Possibilities of treating smelting ore in the concentration plant.

The method adopted for this plant was, therefore,

*Excerpts from paper read before the Australian Institute of Mining Engineers; other excerpts were published, this journal, Oct. 28, 1916, pages 741, 742, 743.

briefly this: Primary crushing to about 40-mesh and tabling. Re-crushing table rejects to, say, 80 or 120-mesh and treating them by flotation.

Smelting Ore.

Tests showed that this also required very fine crushing to get good recoveries. As no work was done with the large-scale experimental plant on this class of ore, the writer confined himself briefly to some laboratory tests, comparative tests on dish vaning and flotation, and straight flotation on smelting ore. Crude ore sample assayed 9.37 dwt. gold, 3.42% copper, 19% iron, 55.34% silica.

The tests show the advantage of combined treatment. The high percentage of iron in the residue should be noted. The brief summary of results which were obtained by the experimental plant when worked on the large scale may be of interest. Results for monthly period ending October 19, 1913, were:

Crude ore milled—tons daily, 83.
 Breaker—average rate, 12 tons per hour.
 Ball mills—average rate, 0.98 tons per hour per mill.
 Flotation plant—average rate, 17.3 tons of feed per hour.

	Gold, dwt.	Copper, %
Crude assayed	6.01	2.10
Concentrate	26.16	10.66
Residue	2.50	0.48
Actual recoveries	68.58%	80.00

The following figures show the actual costs of complete treatment of the ore during the period including trucking from the shaft-bins to the mill and delivery of the concentrates to the smelting works:

	s.	d.
Haulage	8.94	
Breaking	6.86	
Milling	2	2.88
Flotation	1	5.18
Residue		.13
Handling concentrate		3.83
Sundries		.27
	5	4.09 per ton

Flotation costs were divided up as follows:

	d.
Supervision	0.9
Wages operating	1.82
Power	1.46
Stores, general	0.10
Oil (eucalyptus and residuum)	4.98
Maintenance	2.85
Plant and general maintenance	0.62
Sampling and assaying	4.45
	1 5.18

Foreign Copper Visible Supply.

Copper visible supply in England, France and afloat thereto decreased 491 tons from Nov. 1 to Nov. 15, being 11,165 tons on latter date. Recent figures of visible supply compare as follows:

	1916.	1915.	1914.	1913.	1912.	1911.
Jan. 1	20,064	30,309	21,034	40,380	57,283	83,700
Feb. 1	17,646	30,002	16,865	38,228	55,570	83,196
Mar. 1	16,734	29,252	18,559	36,176	51,507	82,387
Apr. 1	12,201	23,883	17,923	32,291	50,175	82,267
May 1	16,046	26,314	20,360	30,467	49,771	78,069

Dec. 1		20,895	30,626	21,514	40,746	58,680

Efficiency engineering is the outgrowth of scientific management.

A Deep-Well Pump.

A high volumetric efficiency can be obtained in deep-well pumping with a triple-acting power pump. The three pistons, operated by cranks set 120° apart, give a powerful and nearly uniform thrust to the water column. The pump here illustrated, after the designs of a Massachusetts inventor, William B. Hewitt, works upon this principle, and is especially constructed to prevent grinding action of sand or grit carried in the water, leakage of water past the buckets.

TRIPLE-ACTING PUMP FOR DEEP WELLS.

loss of vacuum between the buckets, and provides ready means of lubricating the packing rings between the several plungers. As will be seen, the plungers operate one within another, the inner two plungers being each held away from the next outer one by a suitable packing ring. The space above this ring is filled with lubricant, which is injected through flexible tubes as shown. The special packing ring mentioned is shown in the small detail drawing and effectually prevents the passage of liquid downward from the space between the plunger into the similar space next below.

Daily Sampling in Square-Set Mining, Arizona

F. B. HANCHETT.

Too often the metallic contents of ore shipped from the mine to the mill or smelter is far below what it is thought to be by the management, because of inadequate mine sampling. Like some oldtimer who is sure he can make the tunnels meet without the use of a transit, the mine foreman or shift boss thinks, from the appearance of the ore, that it has a good enough content to warrant taking it out for shipment. That may be right in some cases, but in many it is not, and the content of the rock should be known without question before it is mined for shipment.

This requires such a system as the one in use in some of the copper mines of the Clifton-Morenci district. At the particular mine where it is being used, a caving system was adopted some years ago with no

ever, do not attempt to sample each set before it is taken out, but just sample in places selected by the head sampler from time to time. In the system here considered it will be noted that a sample of each set is obtained and the results posted on the timbers for the use of shift boss and foreman, before the ore of

FIG. 1. A PAGE OF SAMPLER'S RECORD BOOK.

success, and the square-set system was resorted to. The ore occurs in different parts of the mine both as a sulphide and an oxide, and in one stope some silicate is taken out to permit of the correct mixture of ores for the smelter. The ores are found in altered limestone and porphyry which are often difficult to distinguish because of the degree of alteration. With the exception of the stope producing silicate, all of the formation is fairly soft, and a sample groove can be made with the ordinary geologist's pick. Ore from stopes producing sulphide is sent to the concentrator at Clifton, and the oxides are shipped direct to the smelter.¹

Two of the companies in the district follow the practice of employing one head sampler with both white and Mexican helpers. These companies, how-

¹For handling and transportation of ore see Mining and Engineering World, Sept. 4, 1915, p. 367.

FIG. 2. SLIP TO BE PLACED IN SAMPLE SACK.

the set is mined out, thus enabling him to avoid doubt as to the contents before the ore is mined for shipment. The samplers are under the direction of the chief mining engineer and are usually recent graduates from a mining school. Each sampler is provided with a large shoulder bag in which to carry 20 to 30 sample sacks, an ordinary geologist's pick, a record book and small block of paper. On an average, one sampler can take 30 samples per day, there being usually three samplers in the mine. The best possible

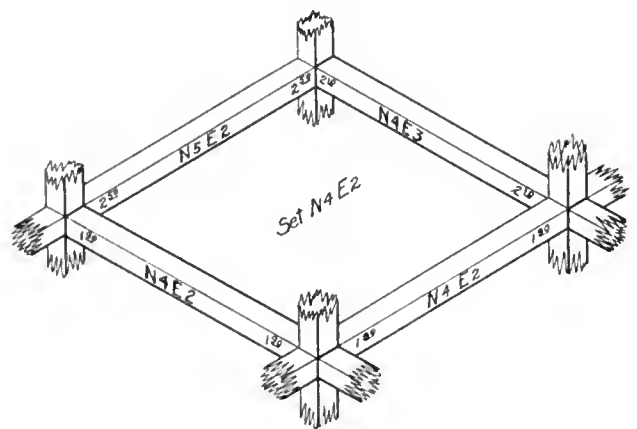

FIG. 3. SHOWING METHOD OF POSTING RESULTS ON TIMBERS.

groove sample, with a geologist's pick, is taken according to the sampler's opinion, while with the other companies the head sampler notes the place and position of the groove for the sampler and the samples are taken with a maul and hammer.

In order to make it possible to get a sample of the

set before it is mined, the sample is taken from any face exposed to sets already taken out. For example, a sample of set N3E5 in Fig. 1 could be taken from the face exposed to set N4E5 or N3E4 both of which have been mined out. For the purpose of recording and locating the position of samples, the following system is used, as noted, in the recording book (Fig. 1). Each stope is first arbitrarily numbered. Each floor is then numbered, beginning with "floor 1" at the tunnel level, from which the raise to the stope is started, and each floor above is numbered successively. That noted in the illustration of the record book is six floors or sets above the level from which it, or the

laboratory for assaying. The sacks are usually picked up by the mule-men or trammers on the level and carried to the mouth of the tunnel, where they are again picked up and taken to the laboratory. The assays of these samples are made by the usual KCn volumetric method. As soon as results are obtained they are posted on a sheet and designated by the set, floor and stope number. Each time the sampler comes to surface he posts these results in his record book in red ink. The assay is posted in the record book in the square representing the set from which it was taken. On returning underground these results are posted on the cap timber with blue timber crane, as also is the set number or co-ordinates. When the set is taken out it is outlined with pencil as noted by the dark lines in Fig. 3.

The results are posted on the timbers in what may seem an unnatural way. Referring to Fig. 3 it will be seen that they are not posted on the face of the timber inside of the set, which it is supposed to designate, and this it will be noted would be impossible if the results are to be posted before the set is mined out, for the ore is inside the set and the sampler cannot get there to post his results. This data therefore is always placed on the outer face of the cap timber with respect to the set it designates. So as not to become confused with the results he has not posted, the sampler goes over the red-ink assay results in his record book with black ink after he has posted the sample underground.

At the end of each month the sampler posts the assays from his record book onto the mine maps.

Miami's Flotation Results.

The Miami Copper Co. has filed with the United States Circuit Court its first statement ordered in connection with the Minerals Separation litigation. The figures, given below, pertain only to that product handled by flotation:

Tons feed	102,698
Tons concentrates	1,370
Per cent copper in feed.....	1.119
Per cent copper in concentrates.....	40.987
Per cent copper in tailings.....	0.58

Despite the fact that it is paying the highest wages in the district and in face of higher cost of all material, Miami has been able to keep its copper costs well in hand. Unless this item shows a substantial increase during the last three months of the year, the average for 1916 will be between 9 and 9¼ cts. a pound.

Many mining companies lose thousands of dollars in wasting time and power, as well as much valuable tonnage, by being too niggardly in the matter of level bosses or under-foremen.

Of the total production of precious metals which ultimately reaches the U. S. mints, more than one-half has previously been refined at the custom smelters.

SURFACE WORKINGS OF ARIZONA COPPER CO.

raise leading to it, was started. Beginning with the set which was part of the raise as an origin co-ordinates are numbered north, east, south and west, each co-ordinate being a set. In this way each set is designated as being so many sets north or south and east or west from the original set. In going up or down to the next floor, the set directly below or above the one in question would be numbered with the same co-ordinates; the only difference being in the floor number. The sampler after having taken his sample places a slip of paper in the sack with the stope, floor and set number on it as shown in Fig. 2. The samples are then thrown down the raises and taken to the

Hulett Unloader as Applied to the Handling of Copper Ore

The excavator shown was designed for the New Cornelia Copper Co., Warren, Ariz., to remove tailings from leaching vats after the copper has been taken from the ore. In the leaching process the ore is crushed to $\frac{1}{4}$ in. and put into a leaching vat by a filling machine, which distributes the crushed ore evenly in the vats. These vats are 75 ft. wide, 101 ft. long and 13 ft. deep, each holding about 4000 tons of ore. The vats, of which there are 12, are in two rows, placed six in a row with a wall between on which the excavator and filling machine travel.

After the ore has been treated for sufficient length of time, the excavator travels over the vats and re-

suspended a bucket leg, carrying at its lower end the bucket shells and operating parts. The leg brace is introduced between the trolley and the bucket leg to maintain the leg in a vertical position at all times. The bucket leg is mounted on a swivel bearing, which will allow the bucket to be rotated seven-eighths of a revolution in either direction from the central position, thus enabling the bucket to reach into the corners of the tanks for cleaning up the tailings. The entire machine is electrically operated.

The bucket shells have a capacity of 10 tons of ore. All of the movements of the bucket and trolley are controlled by one operator, who is located in the bucket

EXCAVATOR FOR REMOVING TAILINGS FROM LEACHING VATS.

moves the tailings and places them into dumping cars. The cars are then taken away by a locomotive and dumped. After the tailings are removed the vats are again filled with ore and treated.

The excavator consists of double-riveted trusses or girders supported on legs and mounted on wheels with a span of 106 ft. One end of the girders is extended to the rear of the machine, forming a cantilever approximately 27 ft. 6 ins. long; this cantilever extension being provided to enable the bucket to reach all parts of the leaching vats.

The trolley carrying the walking beam and bucket leg is designed to travel on rails secured to the top of the main girders. This trolley is similar to those used on the Hulett ore unloaders used for unloading ore from lake vessels, except that it is considerably shorter. The trolley is provided with a moving mechanism, consisting of a rack and pinion, the rack being secured to the main girders of the machine and the pinion on the trolley framework. The trolley will support a walking beam from the outer end of which will be

leg, just over the bucket. In this position the operator is close to his work at all times.

An adjustable limiting device will be provided to prevent the excavating bucket from damaging the matting on the bottom of the tank.

The runways are elevated 5 ft. above the tailing tracks. This is for the purpose of securing the necessary height for the transfer table, which will be used for transferring the machine from one row of tanks to the other. This elevation is necessary for the reason that the tracks for the transfer table are obliged to cross over the tailings track between the two rows of tanks, and the consequent necessity of having the transfer table tracks and the tailings tracks on the same elevation. The capacity of the machine is 500 tons per hour.

The mechanism for controlling the movements of the trolley, walking beam, bucket-opening and closing and the rotating, are located in the rear end of the walking beam, and are controlled by the operator located in the lower end of the bucket leg over the

bucket. The machinery for moving the excavator along the walls is located on the side of the girders, as shown on the cut.

The excavator and transfer table are being designed and built by the Wellman-Seaver-Morgan Co., of Cleveland, O.

Device for Cleaning Oil Wells.

The oil-bearing section of an oil well is apt to become clogged with paraffine, the thickened product of petroleum, and other substances, which prevent free flow into the well. Heat of sufficient volume, applied steadily for a considerable period of time will loosen and melt these deposits. To apply heat under

DEVICE FOR CLEANING OIL WELLS.

the above conditions, thousands of feet below the surface, is a task requiring specially constructed heater, and one used for this purpose is shown in the diagram. It is the invention of Frank A. Monroe, of Jamestown, N. Y.

There is a long tubular casing (10) adapted to be lowered into the well, the two rows of holes shown are for the escape of the steam. Within this casing are five units, one above the other.

At the bottom is a gas receptacle (15) the burner of which is lighted before it is lowered into place. Above this is a fuel (charcoal) chamber (16). The fuel is ignited by the gas flame and kept burning by the latter during the underground operation of the heater.

The burning fuel heats the cone-shaped member (29), which projects up into an open steam chamber. Onto this cone, water is caused to drip from a chamber (18), slowly and uniformly through a needle valve. Pressure in this water chamber is kept practically constant through compressed air admitted to it from the fifth and last unit (19). As the water drips on the heated cone, steam is formed steadily, as long as the fuel lasts. This steam passes out through holes into the outer casing, circulates freely through that, and out through the two rows of holes first mentioned into the well itself.

A Compact Miner's Lamp.

This acetylene lamp is of a size convenient to fasten to the miner's cap, or it can be slipped into the pocket. The two parts telescope together, fitting tightly over a rubber gasket. The water is contained in the upper part and the carbide in the lower, the gas

COMPACT MINER'S LAMP.

chamber being between. To admit water to the carbide, simply pull up the little plunger in the inclined tube, which allows the water to pass through a slot in the wall of the tube. This lamp is the invention of Fred E. Wilkinson of Fairbury, Neb., and Geo. I. Mitchell of Chicago, Ill.

Fuse may become injured in transit, storage or handling, and it is important that fuse be stored in a cool, dry place. Fuse stored in too warm a place is liable to be affected by the melting of the waterproofing materials, and their penetration to the powder. Fuse should be warmed to a temperature from 60 to 70° F before uncoiling, because in cold weather, the waterproof material becomes brittle and will crack, unless the fuse is carefully handled.

Stream Tin Mining on Malay Peninsula.

Andrew Nesbitt, San Francisco, who went to Singapore, the Straits Settlement, Malay Peninsula, several months ago to install and direct the operation of three Evans hydraulic elevators, built by Union Iron Works,

TIN PLACER MINING NORTH OF SINGAPORE.

San Francisco, has returned for a vacation. This equipment is being operated on stream tin deposits, or tin placers, situated in Simpan valley, 200 miles north of Singapore. The tin occurs as cassiterite, or tin dioxide, containing 75 to 78% metallic tin. It is mined and recovered by hydraulic methods similar to those

EVANS HYDRAULIC ELEVATORS.

employed in placer gold mining. The property mentioned is being operated by the Simpan Valley Hydraulic Mines, Ltd., the gravel yielding 1-3 lbs. of tin dioxide per cubic yard. The product is shipped to smelters in Singapore. Nesbitt, who expects to go back to the property in October, states that other similar properties are to be opened and equipped in Leange Valley, Malay Peninsula, next season.

The Alameda-Success Ore Trespass Suit.

The Idaho Supreme court has reversed the decision of Judge W. W. Woods of the district court of Shoshone county in the Alameda-Success ore trespass case, in which it was alleged that the Success Co. had entered Alameda ground and extracted ore valued at more than \$50,000, according to the findings of Referee Lawrence E. Worstell of Wallace, Ida., whom Judge Woods commissioned to take testimony and award damages. The decision was written by Chief Justice Isaac N. Sullivan, and was concurred in by Justices William Morgan and Alfred Budge.

The decision of the Supreme court, in part, follows:

The district court erred in not making a direct and positive finding as to whether the apex of the Granite vein of the Success is within exterior boundaries of the claim. We conclude that under the evidence the said Granite vein has its apex within the boundaries of the Granite claim, and that

TAIL SLUICES AND UNDERCURRENTS, MALAY, PENINSULA.

such vein crosses the east end line of the claim and its westerly end terminates against the Granite or Monzonite, and that at that point the vein is nearly vertical, and that it extends down into the earth at a slight dip to the southwest. Simply because the vein is cut off at that point by the Granite or Monzonite is no reason why it may be followed on its dip downward within vertical planes between the east end line and the point where the vein ends against the Granite.

Under the provisions of section 2322, Revised Statutes, the appellants are given the right to pursue the vein, lodes and ledges throughout their entire depth, the top of the apex of which lies inside the surface lines of said claim extended downward, although such vein, lodes or ledges may so far depart from the perpendicular in their course downward as to extend outside of the vertical side lines of the surface location. The appellant has pursued the vein within the vertical planes of the end lines, and has not passed beyond them, and the evidence clearly shows the existence of the vein or lode in the Granite claim and establishes its identity and continuity from surface downward in the 1200 level.

The case is to be carried to the Supreme court of the United States, according to Charles McKinnis, managing director of the Alameda Co., in which Spokane men, including William A. Nicholls, Frederick Burlidge, general manager of the Federal Mining & Smelting Co., and F. J. Finucane, president of the Holley-Mason Hardware Co., are the controlling factors.

Removing Iron from Tin Ores.

Iron is one of the most unwelcome admixtures in tin ores, since it is reduced to the metallic state in the smelting of the ores in the calciner or furnace, or is dissolved in the tin bath and causes losses of tin owing to the formation of "hard heads"; generally speaking, as much tin is lost as there is iron contained in the ore. In order to reduce this drawback, it has been proposed to remove the iron from the ores in different ways, as by mechanical dressing, magnetic separation, and especially treating the concentrates with chemical solvents, for example hydrochloric acid. The ores contain the iron in the form of oxides or sulphides which by the roasting operation are converted into oxides soluble only with difficulty. On the other hand, lixiviation will produce compounds which are attacked only slightly even by concentrated acids, and therefore the final product obtained still contains a certain proportion of iron.

A better extraction of iron in the lixiviating of tin ores has been proposed by Günzel von Rauschenplat of

REMOVING IRON FROM TIN ORES.

Steglitz, Germany. By his treatment, the higher iron oxides of the original (of if necessary roasted) ore—in some cases after a preliminary concentration by any approved dressing process—are converted into products readily soluble in acids, for instance into Fe_2O_4 , FeO , or Fe . For the reduction of these higher oxides any of the customary reducing agents may be employed, for instance solid coal, carbon monoxide or hydrogen, taking care to keep the temperature so low that the cassiterite is not attacked at all or but incompletely, so that there will be present a tin-oxygen compound insoluble in acids. Gaseous reducing agents are preferred, since with them it is easier to watch the reduction and to prevent contamination by ashes. For hastening the reduction, temperatures lying between 300° and 500° C. are employed, according to the nature of the ore. With these temperatures, the major part of the iron is obtained in the form of FeO , and only a small proportion in the form of metallic iron or Fe_3O_4 .

For the extraction of the iron from the reduced ore, an aqueous acid solution is used, for instance of hydrochloric acid or of sulphuric acid, the reduced product being treated in the well-known manner, say on the counter-current principle, if necessary with heating of the lyes or preferably hydrochloric acid

gas. The dry reaction product is treated with this acid at temperatures lying between 400° and 500° C. The iron is distilled in the form of volatile chloride.

The accompanying drawing shows apparatus suitable for carrying out the process. The ore, after being crushed to a fineness of from $\frac{1}{2}$ to 5 millimeters is fed at (A) into a revolving furnace, which also receives a supply of reducing gases, such as producer gas, from a producer (B) the hydrogen coke-oven gas, or blast-furnace gases, are admitted through a pipe (A') at the lower end of the revolving furnace or drum. This drum and the material are heated either externally, or as shown by preheating the reducing gases on their way to the drum, for instance in iron superheater tubes (A'').

The Manufacture of Ground Barytes.

The treatment of crude barytes to make ground barytes varies in different plants. The general practice, however, seems to be to crush to about 1 in. and log-wash and jig to remove clay, calcite, fluorite, silica, and part of the iron oxide. This cleaned material is next crushed to one-fourth to one-eighth inch at some plants, and at others ground fine and subjected to a bleaching process. The bleaching, largely to remove iron oxide, is accomplished by treating the material with sulphuric acid from 8 to 12 hours in lead-lined wooden tanks. The bleached product is washed several times and ground in burr mills or pulverizers to pass 200 to 300 mesh, and in some plants is water floated to insure a uniformly fine product, and is then dried, pulverized and packed. Much care is required not only in the bleaching, but also in the drying operation to insure a uniformly perfect color. Details of the manipulation during bleaching and of the drying machinery are not made public.

The softer grades of barytes are preferred by the grinders, as there is less wear on the machines in treating this class of material. However, in some plants, hard crystalline barytes is ground successfully. Several grades of ground barytes are on the market, varying from unbleached, coarsely-ground material to the finest grade of white-bleached and water-floated pigment. The following list includes all the companies reporting to the Geological Survey a production of ground barytes:

- Barbour Chemical Works, 707 West Coast Life building, San Francisco.
- Carolina Barytes Co., Stackhouse, N. C.
- Cherokee Chemical Co., 109 Hollingsworth street, Baltimore, Md.
- Elkhorn Chemical Co., Elsinore and Gilbelt avenues, Cincinnati, Ohio.
- J. C. Fink Mineral & Manufacturing Co., 101 Barton street, St. Louis, Mo.
- Nulsen, Klein & Krausse Manufacturing Co., Levee and Sidney streets, St. Louis, Mo.
- Point Milling & Manufacturing Co., Mineral Point, Mo.
- Product Sales Co., 423-425 Equitable building, Baltimore, Md.
- Thompson, Weinman & Co., 100 William street, New York, N. Y.

Valuable Silica Property in Washington. Federal Mining Co.'s Last Dividend.

A quarry of very pure silica assaying 99.4% (quarry run) is owned by the Spokane Silica Co. of Spokane, Wash. This deposit is located 13 miles north of Spokane, close to the Spokane Falls & Northern railway, and has been a great source of wonder and interest to visiting mining engineers and geologists. It stands apart from the neighboring mountains in the heart of a farming district. The deposit is in the form of a small hill better than 100 ft. in height, and covers nearly 17 acres of ground. Large float boulders of granite near its base appear to be the closest associate formation. At a distance it does not appear distinctive, owing to a light covering of moss stain; but close inspection on the surface reveals an abundance of singularly pure natural glass in the form of quartz crystals.

It was originally located for placer gold, but later

The Federal Mining & Smelting Co. has declared the regular quarterly dividend of \$1.25 a share on the preferred stock, or \$150,000, payable Dec. 15, to stockholders of record Nov. 21. This will make the payments for the current year \$510,000 and will increase the grand total to \$15,795,545, of which \$2,708,750 was disbursed on the common stock prior to Jan. 14, 1909. The December payment will be at the rate of $1\frac{1}{4}\%$ of the capitalization, an advance of a one-fourth of 1% over former payments.

The Federal is operating mines at Mace, Mullan and Wardner, and it also holds a 51% interest in the Greenhill-Cleveland group. Its principal producer is the Morning property at Mullan, the chief product of which is lead-zinc, and development in recent months is said to have practically doubled the ore reserves, an excellent high-grade shoot having been opened in an

SPOKANE SILICA CO.'S PROPERTY IN WASHINGTON.

was found to be a very superior glass sand and has had quite a demand for that purpose. It is also used by steel manufacturers for converter lining, paint makers as a paint base, and is found to be invaluable as building sands and tile making material, owing to its brilliant white color and its exemption from impurities. As high-grade glass sand for optical lenses, mirror and bevel plate it is said to be superior to anything found in this country.

More American Tin.—The American Smelting & Refining Co., Perth Amboy, N. J., is planning to bring its electrolytic tin refinery up to its designed capacity. The plant was originally designed to produce 1000 tons per month. However, only half of the units were installed with which to start, bringing the capacity down to 500 tons estimated and 300 actually produced. The remaining units originally planned on will now be installed.

Great care should be exercised in putting on a new elevator belt. It is not wise to try and take out all the stretch at once. It takes the life out of a belt.

extension of the No. 6 tunnel. The mill at the property has been increased to 1500 tons daily, and a much higher saving of the metal values is being effected by the new flotation and separation equipment installed several months ago.

It has been announced by officials of the Federal that the Union mill at Wallace, formerly under lease to the Stewart Mining Co., and now being operated by the Hecla Co., will be utilized in treating the Morning ores as soon as it is surrendered by the Hecla Co., probably not later than Jan. 1. The company intends to crowd production at the Morning, to take advantage of prevailing lead and zinc prices. The mine is capable of furnishing enough ore to keep both plants working at the limit, and it is presumed that the output will be maintained at the maximum.

Work under the direction of a man who has a personal interest in the outcome of it generally results in its being more efficiently done than when otherwise.

The asphalt deposits found at Trinidad and the Red sea are practically pure bitumen.

Steel Production of Record Proportions

The Steel Corporation has produced more steel ingots, pig iron and rolled steel products during the first 10 months of 1916 than in all 12 months of 1915. Other companies have been equally industrious. It is thus evident that the 1916 statistical record will eclipse all previous achievements. Probability is that this year's output of crude and finished steel products will surpass maximum records of 1913 by 5% to 25%.

Corporation subsidiary companies up to Nov. 1 produced 16,482,000 tons of ingots, 13,800,000 tons blast furnace products and 12,790,000 tons of rolled steel products. During the entire year of 1915 the Corporation's total output was 16,376,492 tons of ingots; 13,641,508 of blast furnace products and 12,000,000 of rolled products, of which 11,762,639 were for sale.

Shipments of semi and of fully-finished products by Corporation subsidiaries during the first 10 months this year are estimated to have been 12,345,000 tons. In the whole of 1915 they were 11,681,889 tons.

Orders taken for rolled products from Jan. 1 to Nov. 1, 1916, have been 14,347,906 tons—with October bookings estimated at 1,300,000 tons; but it would not be surprising to find October orders were much heavier. Total bookings in 12 months of 1915 were 16,215,900 tons. Only in orders is the 10 months' record of 1916 less than 12 months' record of 1915; but even at this rate, total 1916 contracts will exceed orders entered in 1915 by about 730,000 tons—equivalent to about 4½%—estimating last two months' contracts on the basis of October sales.

Assuming that production, shipments and sales of independent steel companies rose and fell in same proportion to the Corporation's activities as in former years, the industry as a whole, in the last 10 months, has produced 31,700,000 tons of steel in ingots, 32,631,000 of pig iron—including charcoal iron—and 24,600,000 of rolled products; has shipped 23,740,000 tons of mill and forge shop products and has taken orders for semi and fully-finished products aggregating 27,600,000 tons.

In entire year of 1915 output by all companies included 32,151,036 tons of ingots; 29,916,213 tons of pig iron—of which 23,843,477 tons were used in making steel—and 24,392,924 of rolled steel. Shipments of mill and forge shop products were approximately 23,600,000 tons and contracts booked aggregated 31,500,000.

Indications point to output of 37,475,000 tons of ingots, 38,630,000 tons of pig iron and 26,100,000 tons of rolled steel products in 12 months of 1916. On this basis, shipments of 26,000,000 tons of mill products are indicated, and 1916 steel contracts are likely to be booked aggregating 32,200,000 tons.

Cinnabar, a sulphide of mercury, is the principal ore of that metal.

Whether it Would Pay to Install a Feed Water Heater.

This chart shows the money saving that accompanies the installation of a feed water heater. The old rule on which the chart is based is this: "Every eleven degrees temperature increase of the feed water saves one per cent of the coal pile."

For example, assuming that you spend \$10,000 per year for coal, and that by installing a feed water heater you could raise the temperature of the feed water 110° F. by using exhaust steam that is now going to waste, the money saved would amount to \$1000 per

COST OF INSTALLING FEED WATER HEATER.

year, which is a pretty good "salary" for a single piece of apparatus.

The dotted line drawn across the chart shows how the problem is solved. Just lay a straight edge across and it's "done." Or, stretch a thread across from known point to known point. The answer is always found in the middle column.

To find the increase in temperature just subtract the temperature of the water "entering" the heater from the temperature of the water "leaving" the heater. The difference (T-t) is the value to be used in the left-hand column.

As will be noted, the range of the chart is great enough to cover any ordinary case.

What the Mining Companies are Doing

Greene-Cananea, Mexico.

Results of the Greene-Cananea Co.'s operations in October were as follows:

	Copper, lbs.	Silver, ozs.	Gold, ozs.
October	6,934,000	177,995	915
September	4,900,000	153,495	814
August	5,000,000	144,480	862
July	4,600,000	116,800	745
June	4,590,000	128,700	800
May	5,948,000	183,809	1,139
April	5,348,000	205,748	1,193
March	5,388,000	200,709	1,146
February	5,180,000	181,895	984
January	3,348,000	113,691	716

On the basis of the October production the company has at last reached its normal production.

High copper costs prevail at Cananea due in part to higher cost of supplies, but to a greater extent to the various taxes which have been levied on the industry, including an export tax on bullion shipped into the United States.

Given uninterrupted operations Greene-Cananea could turn out 70,000,000 lbs. of copper per annum at a profit, even with a 13 ct. cost, of better than \$20 a share, against current dividends of \$8.

Barnes-King Development Co., Montana.

Report of the company for the quarter ending Sept. 30, 1916, shows as follows:

Receipts—	
Balance June 30, 1916	\$ 57,413.91
Received during quarter	203,036.62
Expenditures	
Expense at properties	\$260,450.53
Balance	\$ 80,711.54

United Copper Co., Washington.

The report of the company for the third quarter shows as follows:

Receipts—	
Smelter returns from concentrates	\$ 38,276.48
Smelter returns from crude ore	15,767.40
Value of concentrates in transit Sept. 30	26,053.00
Value of crude ore in transit Sept. 30	6,713.84
Total value of returns for 3 months	\$ 86,810.72
Profit boarding-house	472.74
Total receipts for quarter	\$ 87,283.46
Cash on hand July 1	16,909.82
Total cash in third quarter	\$104,193.35
Disbursements—	
Operating expenses	\$51,408.09
Equipment	15,711.94
Land purchased	7,500.00
Bank loans retired	21,000.00
Balance total cash in third quarter	\$ 8,573.32
	\$104,193.35

Tomboy Gold Mines Co., Colorado.

The company's report for the year ended June 30, 1916, shows as follows:

Realized profit for year ending June 30, 1916	£76,923
Balance brought forward from last account	20,778
Total	£97,702
Expenditures—	
Dividend No. 29, 1s per share, Dec. 31, 1915	£15,500
Dividend No. 30, 1s per share, June 30, 1916	15,500
Written off property, plant and machinery	30,000
Income tax paid and reserved	17,000
Balance carried forward	19,702
	£97,702

During the year 150,488 tons of ore have been milled, from which bullion to the value of \$1,074,088 has been realized, at a cost of \$720,866, resulting in a profit of \$353,222. If to this profit be added dividends from the Tomboy Tramway & Tunnel Company, and receipts from other sources, \$29,566,

the total surplus on the year's working is \$382,788. The average working costs for the year, including all expenses in America and London, were \$4.92 per ton.

Magma Copper Co., Ariz.

The following is a statement of the operations of the company for the third quarter of 1916 and comparison with the preceding quarter:

	Quarter ended Sept. 30.	Preceding quarter.
Copper produced, lbs.	2,153,364	2,232,936
Cost of copper per pound, etc.	9.95	10.47
Average price copper, etc.	24.55	24.16
Operating profit	\$314,425.69	\$305,025.19
Average monthly profit	104,808.56	101,675.06

Chile Copper Co.

The Chile Copper Co. produced 4,542,000 lbs. of copper in October. Production for 1916 compares as follows:

	Lbs.
January	2,066,782
February	3,141,480
March	3,536,796
April	3,702,327
May	3,664,000
June	3,610,000
July	3,574,000
August	3,020,000
September	4,028,000
October	4,542,000

Chief Cons., Utah.

The report of receipts and expenditures for the first 9 months of 1916 is given as follows:

Receipts—	
Jan. 1, 1916, cash on hand	\$ 210,034.03
Ore sales, 9 months	976,389.05
Interest, 6 months	2,100.00
Eureka City Mining Co.	71,173.49
Due from smelter	53,527.83
	\$1,315,224.40
Disbursements—

Standard Silver-Lead, B. C.

The financial statement of the company for September is summarized as follows:

Receipts—	
Preliminary settlements for 275 tons	\$33,056.63
Zinc sales	17,137.08
Final settlements for July	4,073.17
Boarding house	4,781.55
Store supplies	2,101.19
Total	\$61,149.62
Less zinc penalty for May	673.42
Balance	\$60,476.20
Disbursements—	
Ore production, including mining, shipping, marketing, power, salaries, expenses and taxes	\$36,287.98
Relative operating profit	24,188.22
Development	4,709.85
Construction	19.60
Ayland tunnel	1,683.30
Balance on hand Sept 30	\$254,219.01

Miscellaneous Company Notes.

It is estimated that the profits of the Calumet & Hecla Co. for 1916 will be better than \$115 a share on the main Calumet & Hecla mine alone. Counting its percentage of the estimated profits of subsidiaries for 1916, share profit will

run close to \$160. Output of refined copper from the parent company alone it is estimated was better than 6,500,000 lbs. for October.

The Alaska Treadwell reports net profits in September of \$64,356.75, Alaska Mexican \$1009.98 and Alaska United net loss of \$35,261.45.

The Kerr Lake Mining Co. in October produced 210,073 ozs. of silver against 203,074 ozs. in September and 244,020 ozs. in August; total production for 10 months was 2,129,805 ozs. of silver.

The Nipissing Mines production for October is valued at approximately \$233,646, showing a profit of about \$151,550, compared with production valued at \$236,873 in September, showing profit of about \$158,929.

More than 125,000 shares of the 200,000-share capital of the Tennessee Copper Co. have been deposited for exchange into certificates of the Tennessee Copper & Chemical Corporation. Outstanding obligations of the Tennessee Copper Co. will be paid off with proceeds from sale of new stock at \$16 a share, and at the same time some much needed working capital will be provided.

The Davis-Daly Copper Co. has entered into an arrangement with the Butte-Detroit Copper & Zinc Co. for the milling of its zinc ore. It is probable that the Anaconda Copper Co. will handle the zinc concentrates produced. Davis-Daly, situated as it is, in the copper zinc area of Butte, should eventually become a substantial producer of zinc. The copper ore of the Davis-Daly will be treated by the Anaconda Copper Co. as heretofore.

Trustees of the Atlantic Mines Co. (in dissolution) the assets of which, with the exception of cash on hand, were sold to the Anaconda Copper Mining Co. at auction on Nov. 1, notify stockholders that after the payment of expenses of the sale and the discharge of all liabilities, there will remain in the treasury for distribution among the stockholders, a sufficient sum to pay \$12.50 on each share. The dividend will be paid on and after Nov. 29 to stockholders of record Nov. 20.

According to a mining engineer identified with the property, Kennecott Copper Corporation's development work is now proceeding so favorably that the mine looks better than it did a year ago. "The falling off in Kennecott's production," he said, "was due to perfectly natural causes. Production had been speeded up through the spring and summer so that company could avail itself of high prices being paid for copper and as might be surmised development work was not carried on as vigorously as it might have been."

It would not surprise those conversant with the affairs of the Utah Copper Co. if that company would declare a dividend of \$4 or \$5 a share. That the company can make such a declaration is evidenced by the fact that the company is earning approximately \$1,000,000 a week, which is considerably more than is necessary to the payment of \$16 or \$20 a year in dividends. Utah Copper is now making its copper at a cost of close to 6¼ cts. per pound. Notwithstanding the increase in wages and other producing costs, according to General Manager Jackling, the company can earn a profit \$15 a share on 15 ct. copper.

An official of the Calumet & Arizona Mining Co. in writing to a stockholder of the company has the following to say of the New Cornelia Copper Co.: "If you will refer to the annual statement of New Cornelia Copper Co. for the year ending Dec. 31, 1915, you will find that the time therein fixed when it is expected the leaching plant of that company will be in operation is June 1, 1917. While we may have had hopes that we might anticipate this time, you cannot expect that under the manufacturing conditions of the present year and the transportation difficulties, that the plant can be in operation as early as in February, and I believe that we should all feel well satisfied if it is not deferred to a date later than June 1. From the commencement of operations, the recovery should be not less than 3,000,000 lbs. of copper a month. Regarding the possible absorption of New Cornelia Copper Co. by Calumet & Arizona Mining Co., it is

impossible to say what the policy may be. Should the tax on corporations continue to increase and especially on that part of their income received from dividends of other corporations, which now pays a double tax, it may be a matter of economy to transfer all property to Calumet & Arizona Mining Co. and dissolve New Cornelia Copper Co. This matter has not been considered. Calumet & Arizona Mining Co. owns approximately 76% of the stock of New Cornelia Copper Co. and about the same proportion of the bonds. The stockholders of Calumet & Arizona Mining Co. will, therefore, benefit by three-quarters of the earnings of that company."

Referee Dexter has signed an order giving the stockholders' protective committee of the Ohio Copper Mining Co., in bankruptcy, right to receive, and directing trustees in bankruptcy to deliver to them, the deed for the property, on Nov. 20, 1916. Hearings were held by the referee on the 10th and 13th of November to fix amounts due on all claims and if said claims cannot be decided by Nov. 20 the committee is to pay over the sum of \$1,250,000. When this amount is paid the referee will set aside former sale and company will revert to the stockholders.

B. A. Brennan, well known to the engineering and industrial world as contract manager of the Westinghouse Machine Co., and later as sales manager of the power department of Bethlehem Steel Co., has resigned the vice-presidency of Mercantile Trust Co. of St. Louis, Mo., to accept the presidency of the Citizens Co., Inc., of Baltimore, Md., to which office he has just been elected. The Citizens Co., Inc., is an investment banking institution, which finances corporations, engages in underwritings, and handles complete issues of securities.

It is probable that the United States Smelting, Refining & Mining Co. will show earnings of better than \$10,000,000 in 1916. October and November showed fully \$1,000,000 net, with the possibility of better than that in December. With its present \$4 annual rate United States Smelting is distributing \$1,945,000 and with note interest and preferred dividends \$4,367,000 per annum. Against this is set \$10,000,000 profits, or two and one-third times all requirements. An increase in the annual rate to \$5 upon the common would involve only \$351,000. The company is selling copper for December-January delivery at 32 cts. a pound, silver is up to 71¼ cts. from the low of 60 cts. in July and spelter has markedly improved. Into the bargain the coal properties are giving a splendid account of themselves—good sales being made regularly.

The Shannon Copper Co is now earning better than \$3 per share per annum on its 300,000 shares. For the first 9 months of this year profits were \$625,000, which is more than sufficient to meet a full year's dividend requirements. At current market prices of around 9 for the stock, earnings are at the rate of over 33% on the selling price and on the basis of dividends now being paid, Shannon yields 22% on the investment. The company recently had on hand \$1,200,000 in cash and receivables. The bulk of the earnings can therefore be paid out in dividends. Shannon's position has also been strengthened by the reduction of bonded debt. There now remains in the hands of the public only about \$125,000 Shannon Arizona Railway bonds out of the original issue of \$600,000.

The American Smelting & Refining Co. will earn practically \$35 per share on its common stock this year as a result of record-breaking operations. No efforts have been made as yet to resume operations at any of the five Guggenheim smelters in Mexico. The Mexican commission, which has been in this country for the past month or two, has before it all facts and figures pertaining to all the properties. Apparently the only tangible result to date was the recent Carranza proclamation extending for 60 days the time in which mining companies must resume work under penalty of forfeiting their holdings. Millions of dollars have been put into the expansion policy of the Guggenheim management in preparing to handle the rapidly growing tonnages of ores of all kinds which have been sent to smelters and refineries of the American Smelting & Refining Co. and its affiliated concerns.

WHO'S WHO IN MINING.

The subject of this week's "Who's Who in Mining," Frederick Laist, has just succeeded to the responsible position of manager of the Washoe Reduction Works of the Anaconda Copper Mining Co., succeeding E. P. Mathewson, resigned. Mr. Laist has been connected with the Anaconda Co. for some time, as metallurgical manager of the Washoe works, and has been responsible for many of the wonderful metallurgical improvements made in the past few years at that plant.

November Mines' Dividends Reach Record Proportions.

November, generally considered a so-called off-month in the matter of dividend payments, was a remarkable exception in this wonder year of 1916, for American mines and works, according to reports made to Mining and Engineering World, divided among shareholders \$15,986,455. Approximately one-half of this amount was paid by the copper companies or \$7,956,216; \$5,386,474 by the companies classed as gold-silver-lead-zinc producers, and \$2,643,765 by the metallurgical companies.

Added to the previous 10 months' disbursements this makes a total for the copper companies for the 11 months of 1916 of \$96,237,030 and a grand total of \$667,767,756.

While the so-called gold-silver-lead-zinc companies were not so prosperous as were their copper neighbors, yet they enriched shareholders in the 11 months of 1916 to the extent of \$81,525,739. United States companies contributed \$69,712,458. Canadian companies \$8,290,892, Mexican companies \$1,172,389 and South American companies \$2,300,000. The grand total for these companies to end of November, 1916, is \$389,394,010.

The six metallurgical companies had an exceptionally good 11 months' period for dividends were disbursed totaling \$22,043,680. Since incorporation these companies have paid dividends amounting to \$274,850,692.

The securities' holding corporations, eight in number, paid dividends during the 11 months of 1916 amounting to \$38,945,499 and their grand total to date is \$156,396,623.

The table following gives a list of the companies paying dividends in November with the date of payment, amount per share and total amount paid. For previous dividends by these and other companies the

reader is referred to tables published elsewhere in this issue:

	Nov.	Per share.	Amount.
American Z., L. & S., Mo.....	1	\$1.50	\$ 342,180
Amparo, Mex.	10	.03	60,000

That New Mining Experiment Station.

The selection of Seattle for the location of the mining experiment station for the northwest, as announced by Secretary Lane, upon the recommendation of Director Van Manning of the Bureau of Mines, is not meeting with much favor by the mining interests of the northwest. It evidently was not Lane's or Manning's idea to have the station anywhere near the center of mining in the northwest. The Mining and Engineering World had no choice in the matter other than the best interest of the mining industry, but to chose Seattle in preference to Butte, Spokane or Salt Lake seems to be just pure politics—not common sense or good judgment, or knowledge of the situation at all.

The way it looks to the Butte people is set forth in the following editorial from the *Miner*:

Butte among several other western cities made a strong bid for the new mining experiment station authorized by congress.

Secretary of the Interior Franklin K. Lane had the selecting of the site and an official of his department came out this way to investigate.

Now comes the word that Seattle has been chosen as the place for it.

If Butte citizens are very indignant about it they are right.

If Butte is not the place for a mining experiment station, then certainly Seattle of all places is not.

Even Spokane, which is near a prominent mining locality, had far more right to it than Seattle.

Butte, of course, was the logical place for it and the official who advised that some such city as Seattle get it in preference to Butte certainly cannot expect this community to feel pleased about his judgment.

If it is logical that Seattle have a mining experiment station then it is just as logical that Butte have a long new line of government wharves built here, or have a navy yard

established on Silver Bow creek, or have that body of water dredged so that battleships can float on it.

Advices from Spokane are to the effect that the decision of Secretary Lane to place the third federal mining experiment station at Seattle will not be accepted as final and that the fight to secure this institution for Spokane will continue.

Spokane plans to appeal direct to President Wilson, contending that giving Seattle a station virtually means two for the Alaskan field, as there is already one at Fairbanks. They assert that Seattle has no tributary mining except coal and that some center of mining should have been chosen. Spokane papers express the opinion that Idaho and Montana mining cities would prefer Spokane as the site rather than Seattle.

An unfortunate tendency on the part of some of the smaller mine equipment houses to "farm out" a part of their work, has resulted from the present difficulty in making prompt deliveries. The danger of this course is well illustrated by the case of the compressor installed about 9 years ago at the Centennial-Eureka mine, Eureka, Utah, the air cylinders of which were Sullivan and the steam end built by another concern. This is known in the Tintic district and throughout Utah as a chronic source of irritation to the management. In the case of mine equipment it is particularly important that there should be an undivided responsibility which will insure the absolutely harmonious, efficient working of all parts.

It is to be regretted that the "Public Lands" conference, which was to have been a part of the nineteenth annual convention of the American Mining Congress, was so completely side-tracked. In fact but a handful of delegates—possibly not more than three or four—appeared to discuss a question which is vital to the entire west, as it involves the right of every state in which there are public lands, to develop its mineral and water-power resources. While in the main body of the Congress resolutions were passed, after but random discussion, covering the subject in a way, even these were lost sight of in the great multiplicity of topics which had been prepared for a three days' session of the Congress.

The committee of American mining and smelting interests which have properties in Mexico reached an agreement with Luis Cabrera, minister of finance in the Carranza government, by which taxes on mining properties in Mexico will be on basis about 40% less than present Carranza decree. In view of higher level of values in minerals at the present time, this agreement is considered satisfactory by American committee. The date when mines in Mexico shall become subject to forfeiture because of non-operation has been extended to Feb. 14 in cases where conditions have prevented operation. Nov. 15 was the date set for the forfeiture of mines which have been idle for 2 months, from Sept. 14, the date on which the forfeiture decree went into effect.

PERSONAL.

Frank G. Stevens is now manager of the Davidson mine, Porcupine, Ont.

D. Gaul, Los Angeles, Calif., is in Globe, Ariz., inspecting mining property.

Titus D. Crawford, mining engineer, Dixon, Wyo., is temporarily in Globe, Ariz.

Walter Neal, for some time in Hall, Mont., has again returned to Salt Lake City.

William Motherwell, flotation engineer, has completed an inspection in British Columbia.

John A. Metcalfe has become mining engineer for the Hobart Iron Co. at Gilbert, Minn.

G. F. Zoffman, Jalisco, Mexico, superintendent of the Cinco Minas, is in San Francisco.

J. Waldo Smith, mining engineer, has made an inspection of copper properties in **Arizona**.

E. B. Kimball, mining engineer, Piedmont, Calif., has returned from a trip to the Wyoming oil fields.

J. V. Richards, mining engineer, Spokane, Wash., is inspecting properties on the Mother Lode, California.

I. L. Merrill, Los Angeles, president of the Hedley Gold Mining Co., has been at the property at Hedley, B. C.

F. M. Field, consulting engineer for the Elling interests Virginia City, Mont., has returned to Los Angeles, Calif.

R. H. Shields, president of the New Arcadian and the New Baltic Mining companies, is in Boston on a business trip.

R. W. Bender, mining engineer, Salt Lake City, is in Elko, Nev., making preparations to operate in the Divide district.

Oscar A. Engelder, until last spring at Sardinia, has been made superintendent of the Verde Combination mine at Jerome, Ariz.

Frederic R. Weekes, mining engineer, New York, will return from a trip through California and British Columbia about Dec. 20.

Jas. T. Fisher of Laurium, Mich., president of the Jerome Victor Co., has returned from a visit to Jerome and other Arizona points.

Everett H. Pattison, mining engineer, Spokane, Wash., is inspecting properties in California and Idaho. He will return about Dec. 22.

F. G. Cottrell, chief metallurgist of the U. S. Bureau of Mines, has returned to Washington, D. C., from Salt Lake City and Butte, Mont.

James R. Finlay, mining engineer, New York, is on professional work in Arizona and will return during the latter part of December.

W. Earl Greenough and F. B. Davis, mining and consulting engineers, have opened offices in Old National Bank building, Spokane, Wash.

Allen Haskett, president of the Globe Bullion Mining Co., Globe, Ariz., has returned from a trip to Chicago, New York and other eastern cities.

Reginald Petre, mining engineer, Baltimore, Md., has been examining the Newray mine in the Porcupine district, Ontario, for American interests.

R. S. Foster, safety engineer of the Butte mines of the Anaconda Copper Co., has resigned to accept a similar position with the Doe Run Lead Co. at Flat River, Mo. He

is succeeded at the Butte mines by T. Oaas, formerly assistant to Mr. Foster. C. E. Calvert has been named assistant.

F. M. Manson, general manager of the Utah Ore Sampling Co., Salt Lake City, has returned from an extended trip to various Arizona camps.

Geo. W. Shaw, efficiency man at the Champion Copper property, has been appointed assistant to Superintendent Brady at the Michigan and Flint Steel property.

W. H. Seagrave, former general manager of the Kennecott Copper Corporation, has resigned and is now in Wallace, Idaho, from which place he will go to New York.

Mortimer North, recently with the Federal Syndicate Mining Co., whose property is near the Phoenix subsidiary of the Keweenaw Copper Co., will join the engineering staff of the Victoria early in December.

H. C. Bellinger, metallurgist, Spokane, Wash., has accepted the position of general manager of the Chile Exploration Co., Chuquicamata, Chile, and S. B. Williamson will have charge of construction for the company.

R. M. Edwards, president of the Franklin, South Lake, North Lake, Algolah, and Indiana companies, who has been at Houghton, Mich., for the summer supervising the management of these mines, has gone to Boston for the winter.

SCHOOLS AND SOCIETIES.

Michigan College of Mines.—Dr. H. M. Payne will deliver a lecture before the Copper Country Michigan College of Mines Club on Dec. 16, on "An Unusual Journey Around the World."

American Institute of Mining Engineers.—The first meeting of the fall season of the New York section was held Nov. 27 at the Machinery Club. Edgar Rickard of the Belgium Relief Commission spoke on the work of American engineers in Belgium. The annual meeting of the Utah section has been postponed to Dec. 16 at Salt Lake City.

NEW PUBLICATIONS.

The Golden Arrow, Clifford, and Ellendale Districts, Nye County, Nevada. By Henry G. Ferguson. Washington, D. C., U. S. Geological Survey. Bulletin 640-F; pp. 11; illustrated.

Each district is described separately as regards the general nature of its formation with respect to ore deposits and deposition. To date the district has not been opened up to any great extent.

Quicksilver in 1915. By H. D. McCaskey. Washington D. C., U. S. Geological Survey. Mineral Resources of U. S. 1:11; pp. 19.

Considerable attention is given to the resources, occurrences and developments in the different states and counties. Prices, imports, exports, world's production, production of the United States and uses of the metal are topics treated on more briefly.

A Method for Measuring the Viscosity of Blast Furnace Slag at High Temperatures. By Alexander L. Field. Washington, D. C., U. S. Bureau of Mines. Technical Paper 157; pp. 29; illustrated.

The variation in viscosity is being studied with respect to changes in temperature and composition and the effect of viscosity on the distribution of sulphur between molten iron and slag. The furnace, details of procedure and some of the results obtained from tests are given. The method consists essentially of an electric furnace into which the slag is put. The furnace is cylindrical and made to revolve on a shaft. At different temperatures the torque exerted from revolution is measured.

Progress Made in the Manufacturing Industries

Pumping Water with Compressed Air.

One of the most interesting air-lift plants in the southwest is located 3 miles northwest of Fort Bliss, near El Paso, Tex. One Class N-SO Chicago Pneumatic compressor pumps two wells each about 600 ft. deep, the water standing about 250 ft. from the surface. The compressor forces the air down into the wells, and although they are not yet

CLASS N-SO, CHICAGO COMPRESSOR PUMP.

entirely free from sand, the water is raised in sufficient volume to supply a town of 2,000 inhabitants. Class N-SO compressors are made in four standard strokes 8, 10, 12 and 14-in. with capacities from 70 to 300 cu. ft. They may be supplied portable (on truck) or skid mounted as well as stationary and are manufactured by the Chicago Pneumatic Tool Co., Chicago.

Gasoline Locomotives for Mine Work.

Gasoline-driven locomotives are solving the haulage problem in a number of mines, and satisfactorily. The first cost is comparatively low, as is the fuel cost. Maintenance and operation costs are moderate and when it comes to actual

PLYMOUTH GASOLINE LOCOMOTIVE HAULING ORE.

pulling power—the ability to do work—they stand up with any other type of locomotive.

In this illustration, for instance, taken in the mine of the American Gypsum Co., Akron, New York, and typical in a general way of conditions in many metal mines, the gasoline locomotive is handling a good string of loaded cars. The over-all height is a little greater than some types of electric locomotives, but at that they are able to negotiate workings of average height.

Some have considered that the exhaust gases might be objectionable, but in that connection S. E. Sill, manager

of the mine, has this to say: "We have been operating now for some 18 months one Plymouth in our No. 1 mine. Our roof is only 5½ to 6 feet high and ventilation is fair, but at no time have we been bothered with exhaust fumes, even when locomotive is working hard on up-grade, the gases seem to disappear at once. On some of our runs the locomotive goes 2100 feet."

The locomotive illustrated is made by the J. D. Fate Co. of Plymouth, O., and is of 24-inch gauge. It has a friction drive, a Continental motor, with certain changes and improvements adapting to the requirements, and Hyatt roller bearings.

Pipe Threading in Tight Places.

This pipe threader is designed to work in close quarters. It was necessary in this case to cut into a 3-inch high-pressure main in a tunnel. A part of the tunnel wall was removed, exposing the pipe, which was pulled over, giving but

PIPE THREADING IN A TIGHT PLACE.

8 inches of clear space for the tool to work in and only 18 inches of space for operation of the ratchet handle.

Threads were readily cut on the two ends, flanges screwed on, the tee inserted and bolted up and the job ready for the necessary extension.

The threader used is known as the "Toledo," manufactured by the Toledo Pipe Threading Machine Co., Toledo, Ohio.

Coupling Flexible in Three Directions.

Simple as it is, this new flexible shaft coupling effectively compensates for misalignment of shafts (off center or at an angle) and for endwise slide. It consists of two cast-iron or steel flanges connected by laminated steel spring pins instead of rigid bolts.

Each flexible pin unit is made up of a bundle of flat

FLEXIBLE PIN UNITS TAKEN APART.

steel springs held flexibly in slotted radial keepers by means of a pin which passes through elongated holes in the spring bundle, as shown in one of the illustrations.

The drawings show how the coupling is assembled and made to compensate for the three irregularities in alignment. In assembling the pin units are inserted through holes near the outer circumference of the flanges, and then held in place at both ends by snap rings fitting into the continuous

grooves formed by cross cuts in the keepers and an undercut groove in the flanges.

If the shafts are off center, the springs bend as shown in the partial-section drawing. If the shafts are inclined at an angle, the slotted holes in the springs allow each shaft

END VIEW OF COUPLING.

to ride on its own center as shown in the longitudinal section, the top edges of the coupling pulling apart and the bottom edges pushing together. When there is endwise

LONGITUDINAL SECTION.

PARTIAL SECTION.

float the slotted holes permit the flanges to draw together or pull apart, with their faces parallel.

These interchangeable parts are easily assembled, and the coupling operates smoothly, without noise or vibration.

A Boiler Purge Made from Wood.

Those who are operating boilers in districts where the water is hard, or contains injurious acid constituents, are anxious to know of anything which will lessen their troubles.

Of late they may have begun to hear of Caldera Purga. The makers of this liquid are just beginning to market it, and it is said that some surprising results have been obtained.

The peculiarity of this boiler cleaning agent is that it is entirely organic in its composition, in fact a wood product. In appearance it is a dark liquid like creosote and somewhat thinner. It does not react upon the water, but its action takes place upon the surface of the boiler tubes, lacquering them to a certain extent. It is said the fluid both removes scale and afterwards prevents its reappearance, by adding a small amount each day to the boiler feed.

Leak-Proof Rings in Oil Pumping.

A. L. Engels of the Shattuck Arizona Copper Co., Bisbee, Ariz., reports some remarkable results obtained by using leak-proof piston rings in oil $4\frac{1}{2} \times 4 \times 2\frac{3}{4}$ -in. Blake Knowles duplex piston packed pumps. These supply the five 100-hp. Atlas return tube boilers in this plant.

One of these pumps was fitted with the new type rings and, under continuous service, a reduction in piston speed of 38% was made possible and still accomplish the same work. The displacement on the pump plungers remained uniform and the danger of fibrous packing clogging the burner slots and valve ways was obviated.

TRADE PUBLICATIONS.

Gas Engines. Chicago Pneumatic Tool Co., Chicago. Bulletin 31-X; pp 20; illustrated.

The Giant gas engine in single cylinder and duplex types is described, the engine as to what it can do, where it is being successfully used about mines, smelters, etc., and what the cost of operation is. Its predominating features are then taken up and in furnishing a description of its construction most of the parts making up the engine are dealt with separately.

Vulcan Steel Frame Electric Hoists. The Hendrie & Bolthoff Mfg. & Supply Co., Denver. Booklet; pp 32; illustrated.

The company states that one object of the booklet is to put before customers something on which to base their requirements which often have to be specially made. A table of details for the different sizes is given. Separate descriptions of the different parts of the hoist and the entire hoist assembled are given. Briefs are included on steam and gasoline hoists, alarm indicators for hoists, electric mine pumps, cages, buckets, etc.

Manganese Steel Sand and Gravel Pumps and Wearing Parts for Pump Dredges. American Manganese Steel Co., Chicago. Bulletin 72; pp 16; illustrated.

With the ever-increasing use of centrifugal pumps in dredging work this bulletin will be found interesting. Illustrations are given showing the separate parts of the company's Acme centrifugal pump and accompanied with drawings to show its construction, besides views of the pumps installed at various places. Considerable manganese steel is used in their construction and the shell is not drilled for stud-bolts to fasten the side plates to the shell with, but a flange with slots for the holes accomplishes this.

Air Compressor and Pneumatic Rivetting Hammer. Ingersoll-Rand Co., New York. Forms 8311 and 3130; illustrated.

The hammers are offered in six sizes, the dimensions and specifications of which are listed in the descriptive table in the catalog. An important feature of this tool is the rivet set retainer designed to meet the regulations and requirements of the safety appliance laws enacted in various states. Form 3130 is on power driven single stage straight line air compressors. They are built in various sizes from 6 to 12-in. stroke with a piston displacement capacity of 52 to 955 cu. ft. per minute and are equipped with the Ingersoll Rogler type of air valve.

Electric and Compressed Air Drills and Sharpners. The Denver Rock Drill Mfg. Co., Denver. Bulletins, 120-E-P; C-2 and Booklet; illustrated.

In the first bulletin electric rock drills are described, a complete view of the outfit being given besides a sectional drawing of the drill. In the second bulletin Clipper compressed-air drills are shown. They may be used either as one-man drills, mounted for drilling and stopping, or unmounted for quarrying, plugging and sinking. The description includes operation, construction and adaptability of the drill. The booklet is on the Sinclair drill sharpener. Its construction and operation are described and a general foreword regarding the sharpener given.

INDUSTRIAL AND TRADE NOTES.

The U. S. Smelting, Refining & Mining Exploration Co. has opened an office at room 1027 First National Bank building, Denver, Colo.

The Lidgerwood Mfg. Company, New York, has opened a branch office in the Hibernian bldg., Los Angeles, Calif., with Charles A. Baechtold in charge.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Dawson.

Many men are going to work this winter in the Chicken Creek district where antimony has recently been found. It assays \$125 a ton with a fair percentage of silver. The vein, it is said, is 18 ft. wide, but owing to the remote location it will not be opened at present. The property was found by Ben Nowall and is located 140 miles up Fortymile river from Fortymile post on the Yukon.

McCarthy.

The Erickson copper group has been purchased for \$100,000 by P. Bonner and associates of Spokane, Wash., and Wallace, Idaho. It is located on Glacier creek. Bonner will have charge of opening the property. To date he has been hauling in supplies and it is his intention to send out several cars this winter.

Seward.

Work of proving ground with an arastra has been stopped for the season by Ronan & James on their Moose Pass property. They are now going ahead with cross-cut work on the 100 level and the result of the work will prove whether the property will make a mine or not. If the result of the tunneling is satisfactory they will work all this winter and install a mill and tramway in the spring.

Operations at the property of the Cache Creek Dredge Co. were stopped Oct. 2 after a most successful season. Manager Harris will remain at the property this winter and it is said 200 tons of supplies will be taken in for the coming season. Two ditches have been constructed to the property so that with the commencing of operations May 1, 1917, plenty of water can be had.

Nome.

A. C. Stewart has located a pay streak 2 miles long on Sledge creek, 13 miles from here. With the spreading of the news most of the remaining ground was immediately staked by others.

Fairbanks.

Bill James has finished 5 holes to bedrock on his new find on Kokomo creek. He finished one hole in which he found pay that showed 65 cts. per foot. The last hole was put down 50 ft. from the first. The ground is 11 ft. deep and 6 ft. of the 11 is muck and 5 gravel. In each of the 5 holes excellent prospects have been found. Pay in the last 3 holes has run from 50 to 60 cts. per foot. The strike was made 2 miles above the forks.

ARIZONA.

Oatman.

Three advanced and modern gold reducing and extracting plants are being constructed, and will soon be under way, in the Oatman district. These mills will embody every late device and process for the treatment of the ores of the district, and will have a combined capacity of from 1000 to 1500 tons daily.

The United Eastern mill is practically completed, and will be grinding within the next 30 days, having a daily capacity of 400 tons. Crushing of the ore will be conducted by both ball and pebble mills, while the counter current decantation system of cyaniding will be used. The ores of the

Oatman district are all of the free-milling type, so that the problems presented to the mill designer are comparatively simple, the chief question being to reduce the costs so that comparatively low-grade ores may be utilized.

A total mining and milling cost of \$3 per ton is predicted when the three new mills of the district are in operation. The machinery of the United Eastern is all in place, and was turned over to the new owners last week, at the time of the annual meeting of the company.

The other two mills are being designed for the Tom Reed Gold Mines Co. and the Big Jim Gold Mining Co., all located on the same general lode system. The new Tom Reed mill will have a daily capacity of 500 tons, and the Big Jim mill either 400 or 500 tons.

The new Tom Reed mill will be located just below the Aztec shaft where an enormous body of ore is now being opened up, estimated to be from two to five times as great in extent and value as the original Tom Reed deposit, which yielded more than \$6,000,000. This deposit is now being explored by sinking a shaft to the 800 level (now down 500 ft.), and by drifting on the 400 level. It is 30 ft. wide, 1000 ft. long, and averages in value from \$15 to \$20 in gold. Orders have already been placed for the electrical equipment and some of the machinery, as from 5 to 7 months' time is necessary before deliveries can be made.

The general plans and specifications of the Big Jim mill are completed, but before the type of machinery is decided upon Manager A. C. Keating will spend a month or more studying the latest methods being used in gold and copper plants throughout the country. The Big Jim mill will be located just west of the working shaft of the company.

With these three mills reducing 1500 tons of ore daily, the output of bullion should be \$30,000 every 24 hours from these three properties alone. This is the production estimated by the managements of these three companies, based upon accurate knowledge of what their ore runs. All of them have ore reserves in sight sufficient to run their new mills from 5 to 10 years, with probabilities of double that amount still to be opened up.

Milling ore by an entirely new process is being done at the Gold Dust plant. This process consists of a Mark's rotary pulverizer and a Simmer centrifugal separator, a combination which it is claimed will reduce milling and extracting costs to \$1 per ton. If this end is achieved it will mean that many properties in the Oatman district having reserves of low-grade ore will be able to mill it at a good profit, which has not been possible with costs of mining and milling running from \$8 to \$10 per ton.

The Arizona Gold Star, adjoining the Ivanhoe, is preparing to resume operations.

Boundary Cone is steady developing on the 550 and 750 levels, and reports satisfactory results in the way of milling ore.

The Gold Road mine is now being operated again, a new development campaign in the eastern end having been started.

The Gold Dust is blocking out ore on two levels, and will soon be milling about 25 tons per day in the Orion mill, which is being remodeled. The Zimmer amalgamation process will be used.

The Black Range is prosecuting a steady development campaign, and is using an old shaft just at the eastern end of the Nellie ground. The shaft is being retimbered down to the 150 level. This is about completed, and sinking will

be started in a few days. Some very fine ore has been cut by this shaft, which is an incline, on the vein.

Miami.

A number of Star churn drills have been ordered from Akron, Ohio, by the new Miami Con. Co. One drill has arrived and is now in operation and a second is on its way to the property. Drill hole No. 1 has been located 150 ft. from the drill hole No. 3 of Miami Southwestern. A good body of sulphides was encountered in drill hole No. 3 of the Miami Southwestern.

At Inspiration a large fan has been installed for taking care of smoke in the heading of the tunnel being driven to the Live Oak on the 6th level. On this same level progress is being made on the construction of a concrete pump station that adjoins the tippie station at the main east shaft. The pump station will be equipped with two units of Aldrich, electrically driven, geared, triplex, plunger pumps, each with a capacity of not more than 50 gpm. At the concentrator excavation has been going on to make room for a large Dorr thickener. This tank will have an inside diameter of 200 ft. and depth of 10 ft. It will be built of reinforced concrete. It will enable the return of clear water from an elevation just below the foot of the mill to the head of the plant. Water returned from this tank will not need to be pumped half as high as the water reclaimed from the tailings dam. In the operation the tailing from the mill is allowed to discharge at about the center of the tank. On entering its velocity is checked and consequently the solid material in the tailing stream settles to the bottom while the clear water overflows. This solid material, or sand collects on the bottom where it is scraped toward a discharge outlet in the center of the tank bottom by means of rabble arms. To carry the weight of the arms a truss will be made with one point of support at the center of the tank, and the other on a track extending around and on the top of the tank.

Aja.

Work will be commenced at New Cornelia not later than June 1, 1917. There are 1200 men now employed and stripping the ore body and grading for the track connecting the mine and mill are rapidly nearing completion. The power plant, being built by C. C. Moore & Co., San Francisco, is to contain five Stirling boilers. These have been placed, one being about half bricked. The building for the coarse crushing plant has been erected; the crane for handling the crusher parts is in operation; the four No. 8 crushers are in place, while 25% of the No. 24 has been erected. The trestle and the trailing track to this building are being completed. At the fine crushing plant the steel building has been erected, but has not yet been riveted. This is to enclose 12 Symons Disc Crushers. Four of these have been placed, while there are six being set up and two in transit. Seven of the 12 leaching tanks have been lined with lead. The concrete work on all of them has been completed. Two of the six central structures which are to contain the pumps and launders have the concrete work finished. The electrolytic tank house is to contain 152 electrolytic tanks, has 122 erected, of which 76 are completely lead lined. The solution sumps, one at each end of this building, have the concrete work completed.

Portal.

Houston.—The suit of the Willie Rose Development Co. against the Willie Rose Copper Co. of Portal for \$500,000 damages has just been dismissed by Judge Charles E. Ashe, in whose court at Houston, Tex., the case had been pending for some time. The motion for dismissal of the suit was made by the defense at the conclusion of the testimony offered by the plaintiff company, upon contention that the company did not have a permit to do business in this state and therefore could not be sued here. The claim for damages was based on the allegation that the defendants had not properly developed a copper, gold and silver mine in Arizona, which, had it been properly worked, should have yielded \$7,000,000 worth of ore. The property was worked under lease contract by the defendant company.

Turner.

Two Peak Co.'s stock was taken from the open market last May but now 100,000 more shares are to be placed at

25 cents. The proceeds will be used for the installation of a hoist and other allied equipment. In the 2-compartment shaft started in October ore is being encountered at a depth of 22 ft. The shaft is being sunk on a claim of the Larrieu-Chadwick group. It is the intention to sink the shaft 500 ft. and crosscut the ore body, which is a continuation of the deposit on the Buck claim, where the ore has been proved for 200 ft. The present shaft's collar is 300 ft. lower than the Buck workings, and when sunk the required depth will be 800 ft. The shaft will be sunk as far as possible by windlass, after which the completion of the wagon road will facilitate the bringing in of machinery.

CALIFORNIA.

Woody.

Weringer Mines Co. is building a concentrating mill of 100-tons capacity at its copper mine, at Woody, 25 miles east of Bakersfield. A gyratory crusher and a 6 by 22 Hardinge ball mill are being installed, the latter to operate in closed circuit with a Dorr classifier, the overflow from the classifier passing to Callow flotation machines. The ore to be concentrated is chalcopyrite.

Confidence.

The Confidence mine, Tuolumne county, which was long idle, is being reopened under direction of Edmund Juessen, mining engineer, San Francisco. The old workings, which go to a depth of 1,000 ft., on a dip of 33°, are being unwatered. A new hoist and air compressor are being installed for sinking and operating.

Scott Bar.

The water supply for the Milne and Andrews hydraulic mine is being augmented and two more giants installed. Ditches and flumes have been placed in good condition and the property will be worked on a broader scale this season than ever before. As soon as sufficient water is available six large giants will be steadily worked. The mine contains about 255 acres of rich ground, the gravel being fairly deep and well located for economical mining. The property was recently acquired by W. Barber of Boston.

Jackson.

The district is rapidly recovering from the effects of the late strike and most of the mines are again operating along normal lines, although there is stated to be a scarcity of desirable miners. However, this situation will soon be remedied, as miners are again coming into the various camps. At the Kennedy 100 stamps are dropping and a normal tonnage is being mined on the main levels. The company is also preparing for extensive operations at the Zelia, formerly one of the premier producers of the lode.

Forty stamps are in commission at the Argonaut, and within a short time the new mill will be placed in operation. This will give the company a total of 60 stamps. A small mill has been installed at the Easy Bird, and sulphurets are shipped daily to the Selby smelter. Unwatering of the Hardenberg and Old Eureka is proceeding satisfactorily. The South Eureka, Oneida, Bunker Hill, Fremont, and other prominent producers are rapidly resuming normal yields.

Angels Camp.

W. J. Loring has commenced operations on the Morgan mine, on Carson Hill, on which he recently secured an option. A new hoist is being installed and it is understood that the winze will be deepened about 200 ft. Loring has been developing the Calaveras and other property contiguous to the Morgan and now has a very extensive area under control, the successful development of which will mean a great deal to Calaveras county. The Morgan is one of the earliest mines of this district and is credited with a production of \$3,000,000. One pocket is said to have yielded about \$300,000, including one of the largest masses of gold ever unearthed. The property is owned by the Calaveras Mining Co.

The Maltman and Sultana properties have been merged into the Angels-Mohawk Co., and drifts from the 300 level have opened a fair tonnage of mill ore. It is planned to sink the shaft to a depth of 1500 ft., and extend drifts to

seek ore bodies opened in neighboring properties. A 5-stamp mill is in commission.

The Angels Deep Mining Co. has negotiated a deal for the Smythe-Brown-Ryland mine, adjoining the Pioneer, and is preparing for active work. The mine is equipped with a hoisting plant, 10-drill compressor, 10-stamp mill, and pumping machinery. At the Pioneer a hoist has been installed and the shaft is being sent to a depth of 500 ft. Some good ore is showing which will be milled at the Smythe-Brown-Ryland mill. John C. Benson is manager.

At the Gold Cliff the mill is running steadily and ore of splendid character continues to be drawn from the lower levels. Sinking is advancing and the shaft is expected to soon intersect a point where the main veins should come together. The Gold Cliff is said to be the most profitable of the mines now operating in this district. At the adjoining Waterman property a 3-compartment shaft has been started and surface buildings erected. The mine has produced much good ore and is well regarded by local operators.

Washington.

Rebuilding of the 10-stamp mill at the Ocean Star mine is being rushed to have it in shape for operation before deep snow sets in. The plant was recently destroyed by fire, supposedly of incendiary origin. Underground work continues and a large tonnage of good ore will be available for the plant. The Ocean Star and several nearby properties are controlled by the Columbia Con. Co., of which E. C. Klinker is manager.

Gaston.

A Hardinge pebble mill has been installed at the Gaston mine. Large bodies of good ore have been opened underground by tunnels and drifts, and the mine is expected to again become a heavy gold yielder. W. L. Williamson is manager.

Placerville.

The Eureka Slate Corporation has been incorporated by New York people to operate the slate quarries at Slatington, 6 miles from Placerville. It is capitalized at \$300,000. Directors are George S. Day, Mary E. McLaughlin, Edward W. Campbell, J. Turner Grieve, and Rollo A. Sanborn, all of New York.

Carrville.

The main ledge has been struck in the lower adit of the Golden Jubilee mine and is being opened by drifts. Some good ore is exposed and indications are favorable for satisfactory results. Good ore is being opened at several points in the main levels. The mill has been improved and is reported to be making a good gold recovery from the refractory ores. The company has also taken a bond on the adjoining Poeth and has arranged for extensive work. The California Extraction Co., of San Francisco, is chiefly interested.

At the Strode, which is being worked under a \$15,000 bond, a 750-ft. tunnel has been started to tap rich shoots exposed in the upper workings. The mine has been worked all summer and a good tonnage of ore milled. The same company has taken a bond and option on the Schlomberg hydraulic mine, on the north fork of Coffee creek, and is improving the water supply and preparing for a brisk season.

The Nash deep-gravel mine has been sold by English owners to San Francisco people for \$10,000 and is again being worked. At the Bonanza King the 10-stamp mill is running steadily on ore of good grade. The Williams & Carter hydraulic mine has passed into the hands of Atkins, Kroll & Co. and will be worked. The same people are reported to have taken a bond on the Headlight quartz mine, with a view to working the sulphide ore by a new process.

Dutch Flat.

Operations have been resumed at the Swamp Angel placer mine, with A. W. Hawkins in charge. Abundant water is now available and large deposits of excellent gravel ready for the working. The mine is an old producer.

Happy Camp.

The Mason Valley Mines Co. is building a 3-mile road from its Gray Eagle mine to the main highway to facilitate

shipment of machinery and supplies. It is planned to have considerable equipment at the mine before snow flies and underground work will be continued all winter. With the arrival of spring additional equipment will be installed and shipments made to the Thompson smelter.

The Savage & Jehogg Co. reports two important discoveries on Horse creek. The first find consists of a strong ledge of gold-bearing ore, about 3 ft. in width, occurring in a formation of limestone and slate. The second ledge averages 8 ft. wide and occurs in a talc-slate formation. Arrangements are being made for development of both deposits.

A road is under construction from the Bradley quartz mine on Independence creek to the Klamath river, a distance of 12 miles. As soon as work is finished large quantities of machinery will be freighted in, including mill and cyanide plant. A large tonnage of good-grade ore is exposed.

Several copper claims are attracting attention. The Williams group of 18 claims is being worked by a strong company, which holds a bond for \$50,000 on the property. The Fairview copper property has been taken over by J. F. McCoy, understood to represent eastern people. At the Ely a lower tunnel is being driven to intersect the ore body, which averages 15 ft. wide on surface. Ore has been intersected at three points and assays high in copper, silver, and gold. The Ely is located on Elk creek.

Alleghany.

The Twenty-One Mining Co. has arranged for the immediate erection of a 20-stamp mill at the Twenty-One mine, replacing the small roller mill at present on the ground. Late work in the mine has opened good ledges and the company is stated to have ample finances for prosecution of deeper developments.

Colfax.

Preparations are being made for resumption of work at the Golden Streak mine. A camp has been established at the property, which lies 2 miles from Colfax. Considerable equipment is on the ground, and sufficient water is available for a long season of operations.

Oroville.

The mill at the Cape Horn mine is being dismantled and moved to the Mascot property, which is being operated by W. T. Baldwin of Oroville. The Mascot is located north of the Old Glory in Morris ravine, and the ledge was recently intersected in the lower tunnel, which gives about 175 ft. of backs. The shoot is 20 ins. wide. It is planned to provide flotation equipment in the spring. The Banner, Butterfly, Bumble Bee, and several other mines are also showing good ore.

Nevada City.

The New England and Mohegan properties at Gold Flat have been taken under bond by J. C. Campbell, and arrangements are being made for early operations. Some rich quartz has been produced and the properties are favorably situated.

Grass Valley.

Reopening of the Norambagua mine has begun, with John M. Nicholls in charge. Unwatering of the lower levels is going ahead, and within a few weeks the new owners expect to start extraction of ore. Eastern people are interested in the company, which also controls the Prudential group.

Ione.

Comprehensive prospecting of the valley between Ione and Carbondale with diamond drills and shafts has established a strata of lignite underlying the area. Much of the coal is said to be of good grade and indications are considered excellent for development of a good coal industry. In pursuance of this plan the briquetting plant of the Lignite Fuel Co. of Ione, has been acquired for \$19,500 by C. A. Johnson, understood to be affiliated with eastern interests.

Plymouth.

In the Amador Star mine at a depth of 227 ft. a strong vein of milling ore has been encountered. It averages 4 ft. wide and is being developed by a drift. Shaft sinking continues and considerable work is going forward at other

points. The property is well equipped and favorably situated for economical operations. It was formerly known as the Rhetta.

Soulsbyville.

A hoist and compressor have been installed at the Addis & Harris mine and sinking is proceeding on a 4-ft. ledge of good ore. The work is now being done with power drills and lateral developments will begin soon. The property yielded rich ore near surface and is expected to become an important producer.

COLORADO.

Idaho Springs.

The Yukon group of the Consolidated Mines Dev. Co. are working 2 shifts on the lower levels. The breast of the tunnel is nearing the first of the four veins that will be intersected by this tunnel. All the buildings, such as blacksmith shop, tunnel house and ore plats, have been completed. On the upper level two veins have been opened. Drilling has been done on the Silver Moon vein for 200 ft. west. For this distance the vein will average 5 ft. wide and assay \$10 to \$32. A raise is now being put through from this level and is in ore that runs from \$30 to \$100, as shown by smelter returns. The last taken from a streak 2 ft. wide in the raise showed \$99.46. The Gold Quartz vein, which will be undercut by the lower level, is the largest vein of the four and has been opened by shallow workings on the surface for over a thousand feet and shows a vein of from 6 to 8 ft. wide from which good ore has been taken from a number of places. In the early spring a power plant will be erected at the portal of the lower tunnel and machine drills installed in the mine. A mill of the most modern type and suitable for the handling of the class of ore they have will also be built, and the flotation process will be one of the chief features in its construction.

Kokomo.

With the installation of new machinery and remodeling of the old Robinson mill which is doing some custom work much activity has been taken on in the district. The Progress Mining & Milling Co. is responsible for remodeling the mill. The mill has been remodeled by the Progress and equipped with new machinery. The process now employed in the mill is an original plan of treatment put into action by the company experts and is based on flotation. Plans for increasing the capacity are being completed and spring will find the mill handling double its present output. During the month of October nearly 1,000 tons of ore were shipped from the larger properties in the Kokomo-Robinson territory. The mill has a capacity of 500 tons. It is equipped with electric motors for power, Sturtevant heating plant, Symons No. 5 and No. 3 crushers, Traylor rolls, 10 Butchart roughing tables, ball mills, 12 Wilfley tables, and 3 flotation machines. The flotation product carries 45% zinc. The tables turn out 30 to 40% lead concentrate with most of the silver and gold. Some of the silver and gold values remain in the iron concentrate. Plans are being considered by the company for the installation of other treatment plants possibly including one for the electro-magnetic separation of iron and zinc.

Pitkin.

The Bon Ton Mining & Leasing Co. has started the Quartz Creek mill, where the success of flotating molybdenite and sulphide ores will be tried out. The mill will be put in operation as soon as new radiators can be installed and it is the intention to keep the plant running all winter. The plant includes a ball mill and flotation process, which were installed during the summer. If successful the capacity will be increased.

Silverton.

Pride of the West has the main raise timbered and all workings cleaned. Active development is now being carried on. As this work progresses all ore encountered will be extracted and sent to the mill. A large territory of undeveloped ground, through which several known veins extend, is to be opened. The old mill, which was operated by steam, has been thoroughly overhauled, and oil flotation for the

treatment of the ores has been installed. Electricity will drive all machinery. The capacity of the mill has been increased, and the management has planned to treat 100 tons daily.

The old mines of the Pride of the West and Green Mountain groups are to be reopened. Development was carried on several years ago at the Green Mountain. At present, the main tunnel is caved in for 400 ft. The tunnel is being cleaned out and the company expects to extract a large tonnage of good ore from ground already blocked, besides exploring new territory. The Green Mountain tunnel is in 1500 ft. At 600 ft. a raise was made to surface.

Telluride.

Mill Supt. W. L. Reid has proven flotation satisfactory for treating ores of the Smuggler Union Co. Old cyanide tanks are to be taken out and additional flotation units put in their place.

Black Bear shaft is finished from the 450 to the 200 level. When the shaft is completed the company expects to blast out a place for a big storage bin at the mouth of the shaft and arrange for a self dumping skip.

Carruthers mill, in Marshall basin, is ready to begin operations as soon as the tramway from the mine to the mill is in condition for use, which should be soon.

Nick Jurich Leasing Co. is taking ore from the Butterfly lease and milling it at the company mill. The mine is being worked steadily with a small force, but the mill is only used about one-third of the time.

Columbine.

The Royal Flush mine, owned by the Hahns Peak Gold Mining & Milling Co., Columbine, Routt county, after several years' dormancy, is now producing smelter ore and mill concentrates, under the supervision of Chas. T. Arkins, consulting engineer, of Chicago. Last winter and spring a raise 400 ft. was made, connecting the lower and upper tunnels, which raise was necessary for proper and natural ventilation of the mine, the raise being now also utilized as a working shaft, from which exploratory drifts, north and south, are being pushed for development of ore bodies. A recent strike of ore, carrying ruby silver, was made. A shipment of smelter ore and mill concentrates will soon be made. It will be recalled that the district in which this mine is situated, the Hahns Peak district, was the scene of great activity, 20 years ago, lode mining at that time receiving impetus by reason of placer gold production, previously, prospectors at that time searching for the source of the placer gold, which was generally believed to have had its origin on Hahns Peak.

IDAHO.

Wallace.

The Anaconda Copper Co. of Butte, Mont., operating the Douglas mine, under lease and bond, has let a contract until March 1, 1917, to C. M. Shipley and Bert Fox of Wallace, to transport ore to the railway at Pine Creek station, 9 miles. The contractors will employ five 4-horse teams, and will handle about 16 tons of ore daily until sufficient snow falls for sleighing, when the shipments will be increased. A compressor plant, hoist and pump have been ordered for the Douglas, and the equipment will be taken in by the ore teams on the return trips, the machinery having already been delivered at Pine Creek. It is said also that the company is preparing to install a concentrator at the mine, and that the ore will be given a "rough milling" to eliminate the haulage on waste material. The product is to be treated at the company's new electrolytic zinc smelter at Great Falls, Mont.

The Jack Waite Mining Company, which owns and has been developing the Jack Waite group of lead-silver-zinc claims, will resume shipments in a few days, according to announcement. A steam power plant, adequate to serve the needs of the property for several years, has been installed, and the management contemplates maintaining operations throughout the winter. Development for the last 18 months has opened several stopes of commercial ore, and the shoot in

the upper levels is said to average 6 ft. wide of excellent mill feed. Shipments will be made from Eagle, the nearest railway point. C. I. Grimsloe is in charge of operations, and Rush J. White, formerly mine superintendent for the Federal, is consulting engineer. The Jack Waite group comprises three claims and two fractions on Tributary creek, and the ore bodies have been extensively developed by several tunnels, drifts and raises, more than 1000 tons of ore having been shipped. E. Winsby, president of the United Iron Works at Oakland, Cal., is president of the company, and a number of Spokane men are heavy stockholders.

An important strike has been made in the claims of the Northern Light Mining Co., in the Pine creek district, according to the announcement by Ben G. Harmon, general manager. The discovery was made in a crosscut from the shaft on the 400 level, where it is said the vein is 25 ft. wide, 5 ft. of which, on the foot-wall side, is said to be high-grade lead and zinc, while the remainder of the body carries streaks of steel galena and high-grade zinc. Assays of the entire show average values of 7.5% lead, 9.5% zinc and 20 ozs. silver. Drifts are now being run east and west. Of the capital stock of the company, 1,200,000 shares are owned by St. Paul capitalists represented by Harmon, the manager of the property, leaving 300,000 shares in the hands of scattering stockholders. Tuesday T. C. Borg, head of the Borg Furniture Co.; Dr. M. C. Welch and Tom J. McGrath, treasurer of the company, all of St. Paul, arrived and will spend several days inspecting the property.

The Highland-Surprise mine on Pine creek, will practically double its milling capacity, and as soon as the improvements now under way are completed 30 additional miners, will be put to work, according to W. W. Papesh, president of the company. Another cell is to be added to the flotation plant, and the present small crushers and rolls are being replaced by 40-in. rolls and crushers of double the former size. This will give the mill a capacity of from 150 to 175 tons daily. These changes will be complete in about 10 days. Physical condition of the mine shows an immense tonnage blocked out for shipment. The Highland ore body is being blocked for a length of 480 ft. with a vertical depth of 440. Stopping is under way on this body, which shows fine ore on both ends of the drift, running from 2½ to 12 ft. in width and carrying 14% zinc, 8% lead and 5 ozs. silver. The management expects to ship not less than 50 tons of concentrates per day as soon as the improvements are completed.

Mullan.

Owing to water pressure, estimated at 150 lbs. to the square inch, further diamond drill exploration of the strike recently made by drilling in the Copper King mine, has been abandoned temporarily, according to reports from H. W. Ingalls, secretary of the Copper King Co., who states that the drill had penetrated the ore body for 48 ft. without crosscutting the ledge. "The first 15 ft. is estimated to average 10% lead, and the last 15 ft. apparently is much better," said Mr. Ingalls. "We probably will begin crosscutting to the ore body soon from a point in the west drift about 400 ft. back from the face. This should tap the ledge in about 100 ft., and by drifting for about 400 ft. we should reach the place where the diamond drill broke into the ore. This we think will be better than crosscutting along the drill hole, which is about 480 ft., as we will be able to explore the ledge as we go, besides straightening out the workings."

Kingston.

Following an examination of the property by its representatives, the Rex Con. Mining Co. has taken a tentative option on the Hypotheek mine. The Hypotheek recently has been equipped with a 200-ton concentrator and power drills, and regular shipments are being made to the smelter at Northport, Wash. The crushing department is capable of handling 500 to 600 tons of ore daily, and the treating facilities can be increased to accommodate the output of the rolls with comparatively little expense. Current to operate the equipment is secured from the Washington Water Power Co.'s transmission lines.

Gem.

The addition to the Hecla Mining Co.'s mill is nearing completion and probably will be operating by Dec. 20, when

the company will surrender its lease on the Union mill of the Federal Co. at Wallace. The new unit will have a capacity of about 200 tons daily, increasing the entire plant to 700 tons.

The flooded workings of the Marsh, closed down for several months, are to be unwatered and active operations resumed. Search for the easterly extension of the Tiger-Poorman vein is to be continued, and other plans contemplated are to be made effective. These include sinking the shaft to the 1100 level, crosscutting from the 400 level south into the O'Neil claim and further exploration of the Got-Em-Now vein from the lower shaft levels. Accompanying the report is notice of the first assessment of the Consolidated Marsh Mines Co., 10 mills a share, delinquent Dec. 20. The company is incorporated for 2,000,000 shares at \$1 each, and approximately 1,500,000 shares are issued. The corporation now is controlled by Duluth men, closely identified with the Consolidated Interstate-Callahan Mining Co., who have acquired all the interests formerly held by the Dixon-Cowles coterie of Missoula, Mont.

Burke.

For a reported price of \$500,000, control of the Hercules mine has passed to the Day interests. The aggregate interests of the Days in the Hercules now amount to slightly more than a half interest.

LAKE SUPERIOR.

COPPER.

Houghton.

The older type of drills, like Sullivan and the original Leyners, are rapidly being displaced in both the copper and iron country by Ingersoll-Rand, water Leyners, Denver and others of modern design. Recent selections have been based almost entirely on actual working tests and represent an encouraging tendency of mine executives to follow very closely the recommendations of their superintendents.

Franklin is taking steps to increase its tonnage one-quarter to one-third, having begun this work about a month ago when it started to send to its mill about 1050 to 1100 tons daily where it had previously forwarded only 900 tons. This increase will result from the introduction of several ideas by Supt. Henderson. The improvements were adopted on the 28th level and are: a method of rope haulage using rope tramming operated by a compressed air engine; the "caving system of mining" by which the drifts are carried to the dividing lines between the shafts, the good rock is taken out with the clay seam 2 ft. thick to the hanging wall by a low-cost method of raising called "caving." Expensive timbering is avoided since it is no longer necessary to hold up the hanging wall to protect the drift; the concentration of 8 drills together in a row; the supervision by one boss, saving in the use of supplies; the handling by one man of the explosives, better drill service, etc., are among the items. The cost of tramming labor has been reduced from 20 cts. to under 5 cts. a ton, and the saving in the cost of breaking is in about the same proportion. Dec. 1 the same system with one 4½-ton tram car will be put in on the 30th level and about the 15th on the 31st level. A 4th level will be ultimately similarly equipped, but the mill capacity will have to be increased—a subject that is now under consideration. As the mine with a daily tonnage of 900 tons was earning \$30,000 it will be readily seen what it will earn with the 3 levels and the drifts breaking down steadily 1400 to 1500 tons.

The Baltic is finding the West vein quite dependable as a steady producer except at No. 3 shaft where it has not been fully tested. No. 5 is sending all its rock from this lode. No. 4 more than 50% of its output, and No. 2 has found it good where it was opened at the 16th level. Being within 40 to 150 ft. only from the Baltic lode itself, it can be very easily mined; and it is probable that when regularly and extensively mined the mineralization will have a much larger area.

Michigan will begin to drift on the Evergreen lode and for this purpose will transfer the drills that have been opening up the main crosscut, which has been driven 60 ft. be-

yond the lode. This lode in the crosscut had 25 ft. of vein carrying but little copper, then 15 ft. that was almost commercial, and 5 or 6 ft. of the same character as the first stretch followed by 8 inches of vein rock called epidote. The drill will be set to work in the second strip, which is considered most promising and which here is merely one of the poorer places that so often occur in amygdaloid. The Ogimah lode, which has been drifted on for 275 ft., gives a commercial average for the whole distance; the Butler is still seeking the mineralization that was interrupted by a fault some time ago on the western side and will connect its raise in the longitudinal fissure lying 6 ft. above with the drift on the level next higher, the 5th, in a few days. The copper from the Ogimah lode is all shot copper, and that from the Butler is largely mass of different sizes.

Victoria in 6 months, which time it will take to get everything at the mill and mine in the proper running condition, will be milling 700 tons a month as compared with 550 now. This will be up to the capacity of its stamp. New tables are being built for the mill which will be put in the highest state of efficiency. The ground at the bottom of the mine is developing satisfactorily as far as can be done at the present until the 12 new valveless drills of the Denver Rock Drill Co.'s Dreadnaught pattern arrive. The 23d and 26th levels are giving rich, heavy rock which was met with in wide stretches on the 24th level, the former being opened for 100 ft. The 25th is displaying excellent grades of shot copper with no mass or barrel. It will be remembered that all the machinery at this mine and mill is operated by compressed air from its hydro-pneumatic plant cut out in the sandstone cliff located close to them and that 10 lbs. of copper a ton will pay a profit, so that when the tonnage that now yields a handsome profit reaches its maximum for its one stamp, 700 tons daily, it will pay well.

Calumet & Hecla is getting 5500-5600 tons daily from its Calumet conglomerate where it has all the men that are needed. Men with previous experience in this district are preferred here and can be usually obtained. All men except timbermen are working on contract, and trammers, whose minimum here is \$2.75, are averaging from \$3.50 to \$3.75, and miners whose minimum is \$3.50 are averaging over \$4. There are now 170 drills in operation on this lode.

New Arcadian has probably the best strength yet met with at the mine on the 1050 level north at a distance of 450 ft. towards the New Baltic boundary which will be met with 700 ft. in. The northern drifts have been carried in further than the southern and have all averaged good.

Federal Syndicate Copper Co. has just been organized with a capitalization of \$1,000,000 with 1,000,000 shares and a par value of \$1 under the laws of South Dakota. It purchased the Federal Copper Company's lands, located southeast of the Phoenix from P. L. DeVoist of Duluth through H. E. Murray of Calumet, Mich., who is also negotiating with the heirs of Charles Kingston for two farms adjoining comprising 120 acres which, with the company's 360 acres, would give a total of 480 acres supposed to carry the Kearsarge lode. The new organization is a carrying company and its property will be worked by the Michigan Development Co., now in process of organization. The officers are: A. C. Steinlow, president; P. D. MacNaughton, secretary-treasurer; J. S. Sebree, assistant secretary; directors, the foregoing with P. L. DeVoist and Ernest LeDuc. Mortimer North is in charge of the engineering work.

Adventure will begin to make shipments from the Butler and Knowlton lodes about Dec. 1 to the Winona mill. The greater amount of the rock will come from the Butler, as it is the richer, though there are some good stopes on the Knowlton. It is expected that soon after the start three to four cars will be sent daily. At this mine when mining was closed down on the Butler and Knowlton lodes about six years ago the yield had run down to 10 lbs., but that can be made to pay now and it will give an opportunity to explore them, particularly the Butler that has encountered such good values at the South Lake to the north and at the Mass to the south.

Flint Steel has reached, in dewatering its No. 3 shaft, the 3d level, which is about the bottom, and has drained through this level its No. 2 shaft which is about 450 ft. distant. It

is learned from outside sources that the exposures of the metal are up to the average of the Butler lode on which these shafts are situated.

Cherokee has begun sinking and is in heavy copper, which was also found where the sump for collecting the water was cut out. The crosscut made from the other drift is 23 ft. across the width of the vein, assuming it to be the same as on the surface and the face of the crosscut is now in good copper. The showing as a whole averages high grade.

IRON.

Escanaba.

The Munro mine has commenced shipments via Escanaba, the first being made from the new open pit on Nov. 16. Two shifts are operating and Hoose & Person have the contract for both shipping and mining.

The Great Northern Ore properties have announced an increase of \$1 a ton for bessemer and non-bessemer. The increase will be effective Jan. 1, 1917, and will bring bessemer ore up to \$5.20 and non-bessemer \$4.55.

The ore rate from ports at the head of Lake Superior for 1917 were established, when two leading shippers made freight contracts to run for the season at \$1 a ton.

Chartering was not heavy, as the bulk of the tonnage was tied up ahead. It is estimated that the business done established the rate for more than 40,000,000 tons of vessel capacity. Nearly all the shippers have reserved tonnage at the going rates and now that carrying charges have been fixed the reservations will be turned into contracts. In 1900 the rate was \$1.25 per ton.

Ludington shaft stock-pile of the Oliver Iron Mining Co. is being loaded for an order received to ship an additional 25,000 tons. Including the shipment now in hand the company has shipped to the Escanaba docks this season about 550,000 tons of ore. This is an increase, in comparison with 1915 of over 100,000 tons.

Virginia, Minn.

The Oliver Iron Mining Co. intends to do considerable stripping here and in the Adams district. Orders for 100 all-steel 20-yard air dump stripping cars, to cost \$300,000, have been placed and are to be delivered by March 1.

Officers of the company believe that the cars will effect a saving in the cost of removing the overburden next season. They are of a heavier type than any that have been previously used. The total weight of the car and dirt carried by it will exceed the total load of the heaviest cars thus far used in ore transportation. Formerly in stripping narrow-gauge cars holding only 3 yds. were used. In the Virginia district the Mesaba mountain will be removed. It is said that under it lies a large bed of fine ore. In the Adams district work will be prosecuted at the Adams farm, where deposits that have been worked for several years through shafts will be uncovered and made open pits.

MISSOURI-KANSAS.

Joplin, Mo.

Under the stimulus of a strong spelter market and a shortage in production of both zinc and lead ores, the market climbed to \$105 top basis price Friday afternoon last week. Operators in the Joplin district who had confidently expected to receive \$100 per ton for their ores, the great majority of them holding their ore from the previous week, were rewarded in receiving even more than they anticipated, \$105 per ton. Lead sold for \$87.50 top price, \$85 base. Calamine sold for \$60 top price, \$55 base.

What promises to be one of the very best hand jig properties in the district is being developed by the Mary Jane Mining Co. at Tuckahoe. A battery of four jigs is being reinforced by three more this week, and it is expected more will be needed in the near future. Drifts have been sent out in three directions from this shaft, and in each an excellent face of ore has been developed.

The Etta May Mining Co. has installed another concentrating plant west of Bell Center. The mill started short

shift some weeks ago, and a number of small turn-ins have been made. W. P. Howard is superintendent.

Chas. Edwards and associates have proved up a rich ore body at Chitwood on the Granby land. A total of 10 holes have now been put down and in every one a good run of jack has been shown. Edwards expects to fully develop this property.

Operations for the erection of a 100-ton mill by the Mary L. Mining Co. on its 21-acre tract of the Missouri Lead & Zinc Co.'s ground, situated near 22nd street and Ohio avenue, have been begun. A deal has been closed for the purchase of a mill in the West Joplin district, the machinery of which will be installed in the new plant. In the course of sinking the shaft the company took out about 200 tons of dirt assaying on an average of about 20% blende, according to one of the partners.

A company of Joplin men has taken a lease on the old Aylor shaft, north of Joplin, installing a 4-in. Gardner pump. This was formerly a good property, operations being conducted at a depth of 125 ft.

Webb City, Mo.

The Twin City Mining Co., situated on a 14-acre tract of the Aylor land at Prosperity, is averaging about 100 tons of high-grade concentrates weekly. This company has one of the best equipped mills in the district, having several months ago erected a new 400-ton plant. Operations are being carried on in sheet ground, the dirt averaging about 3% recovery. Since February, 1916, \$90,000 dividends have been declared. George Moore of Webb City is president of the company.

The Bizzy Izzy Mining Co., east of Joplin, in the Duenweg camp, has opened up a good sheet-ground formation at the 180-ft. level. The ore is all high grade, and probably will average 4 to 5% lead and zinc.

The Schoolhouse mine at Carterville has been taken over by the Chapman-Hosley Mining Co. and will be operated once more as soon as necessary repairs can be made. This is a sheet-ground proposition and already a large tonnage has been taken from it. The lease consists of 120 acres of land.

Miami, Okla.

Another new mill is being erected by the Commerce Mining & Royalty Co. The new mine will be known as the Woodchuck, and should be ready for operation by the middle of February, if not sooner. The plant is located only a short distance from another new mill being erected by the same company, to be known as the Blue Jay.

The Rebekah Co., after a thorough prospecting campaign, has started the erection of a 250-ton mill. This company has leases on 250 acres of land slightly less than 4 miles north of Commerce. Out of a total of 10 holes put down, only one proved a blank, while in the others a rich formation is indicated by the cuttings. J. E. Hoeshal is president, Lewis Langhorn, vice-president, and W. A. Wood, general manager.

Several big mines have been developed in the Century Oklahoma zinc and lead field within the last year, the most important of which are the Welsh Mining Co., Montreal Mining Co., and the Mihoma Mining Co.

The Miami Zinc & Lead Co. is installing three 150-hp. pressure boilers to supply steam to make its electricity and to operate the hoists at the various shafts. Operations underground is being carried on at the 300 level.

MONTANA.

Butte.

Alleging that the Butte & Superior Mining Co. was dishorsing dividends in excess of its earnings and was attempting to dispose of its assets through a contemplated merger with the American Zinc & Lead Refining Co., thereby leaving only a bond of \$75,000 to indemnify the Minerals Separation Co. in the event that the latter won the flotation case now before the supreme court, the Separation Co. has asked Judge Bourquin either to enjoin the Butte & Superior from

the payment of further dividends pending the final adjudication of the case and to restrain the proposed merger or else to require the Butte & Superior to increase adequately the amount of the bond.

H. D. Williams of New York, counsel for the Separation Co., stated that they claimed damages and profits on the flotation process, which patents the Butte & Superior is alleged to have infringed upon to an amount in excess of \$15,000,000, and that the last quarterly statement issued by the Butte & Superior showed its quick assets to be \$2,000,000, as compared with a statement of about a year ago, in which that item was given as \$5,000,000. He claimed Butte & Superior output had reached a value of more than \$16,900,000 at a cost of around only \$1,000,000 through the use of the flotation process.

Judge Bourquin intimated that he considered that the Minerals Separation Co. was entitled to greater protection than was afforded by the present bond, and he suggested that the Butte & Superior certify to the Separation Co. that a sufficient sum to cover all possible damages would be kept in the treasury in the event that the plaintiff won in the final issue. The court explained that this was only a suggestion, and Attorney J. Bruce Kremer for the Butte & Superior replied, stating that he was powerless at this time to assent to such a suggestion.

Judge Bourquin, continuing, expressed doubt as to his jurisdiction in the case, inasmuch as the appellate court for the Ninth district had reversed the decision of the district court, which had found for the Separation Co., and the supreme court had granted a writ of certiorari, removing the case from the appellate court. Judge Bourquin stated that he would have to look into the matter, and the petition of the Minerals Separation Co. was taken under advisement.

Anaconda has finished driving the crosscut, started several months ago, from the 1800 level of the Original mine, under the business section of Butte, to the 1600 level of the Emma. Sinking of the Emma shaft has started, simultaneously with upraising from the 1600 level, which work when completed will increase the depth of the Emma shaft from 800 to 1600 ft. The Emma shaft, when completed to the 1600 level, will provide an air chimney and help to cool the lower levels of the Original and Stewart mines. It is stated that drifting on the 800 level of the Emma has developed substantial ore bodies. The drift is said to be now at a point just south of the Oxford hotel, in the direction of the Davis-Daly ground.

A rich strike of copper ore is reported in the Butte Main Range. According to the statements the miners are in about 8 ft. on the vein and the ore body, which is reported to be about 4 ft. wide, runs all the way from 10 to 15% copper with some silver. The Butte Main Range shaft is down to a depth of 700 ft. and it is from this level the vein is being worked. The same vein is said to run through the Colusa-Leonard property, owned by the Tuolumne Co., and adjoins the Butte Main Range. The officials of the Tuolumne admit that a rich strike of ore has been made and also admit that they are in on the vein to about 8 ft. with every indication that the values will be maintained. As a result of the strike Tuolumne advanced several points on the local exchange today. The Tuolumne is a large stockholder in the Main Range. The Tuolumne has a contract under which it is purchasing monthly allotments of Main Range stock.

Articles of incorporation of the Summit Valley Security & Development Co. were filed with the clerk and recorder this week. The capital stock is \$100,000 with a par value of \$100 a share and the company is to have an existence of 40 years. The objects of the company are stated to be a general mining business with the usual conditions attached as to the purchase or leasing of properties and the erection of buildings in connection with the operation of mines. The five directors are Dr. T. V. Moore, G. O. Dayton, T. C. Truscott and R. M. Green of this city and M. W. Atwater of Basin.

A prominent Butte millionaire and retired banker, who wishes to keep his name out of the papers, gave assurance this morning that he will give a substantial amount to boost the movement on foot for the construction of a Miners' Home to which patients suffering from miner's consumption

will be admitted. Last night Patrick Wall declared he will donate \$1,000 to the fund and in addition will do everything possible to complete the work of building the home in Butte. "The committee may count on a substantial sum from me, but I do not want my name connected with the movement," said a wealthy man who is interested in the welfare and comfort of Butte miners. This man declared that he has been eager for a long time to do something of a substantial and direct benefit to the miners, the men who made Butte the city it is today.

Deer Lodge.

A. Rippingale, Frank Brown and Fred Mundinger were here this week from the Champion mining district. They are running a tunnel on the old Ben Franklin claim and expect to continue this work during the winter months.

Lewistown.

The Cumberland at Maiden this week shipped out to the Denver mint a \$7000 gold bar. This property, operated under a lease, has become a regular producer and is showing up better all the time. James Breen of Spokane is now the chief owner and he went out to inspect the property. The Spotted Horse and Maginnis at Maiden are also being successfully worked under lease.

NEVADA.

Goldfield.

Drifting has begun from the 1100-ft. level of the Silver Pick shaft to intersect the ore channels indicated by the Calyx drill. In the bottom of the shaft the quartz is showing higher assays than further up, with copper appearing in increasing quantities. Changes are being made in the pumping system to facilitate sinking of the shaft to the alaskite, and establishment of a level on the shale-latite contact.

The Silver Pick Extension Co. has been formed to work 120 acres adjoining the Silver Pick mine on the West. Herman Zadig is president, C. G. Patrick secretary-treasurer, and George F. Dyer consulting engineer. Developments will be by way of the deep workings of the Silver Pick.

Additional equipment for the 1000-ton flotation plant of the Goldfield Con. is expected to arrive shortly and the management is sanguine of resuming normal operations early in January. The sulphide gold-copper and the usual mine ores will be treated by flotation, and the cyanide department operated on tailings, of which about 2,000,000 tons are available. It is reported some custom ore may be also treated for neighboring companies.

Manhattan.

Sinking of the White Caps shaft is proceeding rapidly and as soon as the 435-ft. level is gained, east and west drifts will be extended to intersect the ore-shoots exposed at the 310-ft. point. Foundations are being erected near the main shaft for the roasting plant, and the mill and cyanide department will also be moved to this point.

Elko.

The Hidden Treasure group, 1½ miles from Aura, has been leased to W. D. Chambers and associates by R. S. Carmichael and William Vore of Elko. The ore carries gold, silver and lead, and about 1200 ft. of developments have been performed. A small force will be employed during the winter, but with the arrival of spring developments will be prosecuted on a broad scale. The Hidden Treasure produced some rich ore about 20 years ago and has been in the hands of the present owners about 14 years.

NEW MEXICO.

Mogollon.

Socorro Mining & Milling Co.'s product for first half of November was 18 bars gold and silver bullion.

Mogollon Mines Co.'s clean-up for same period yielded 820 lbs. gold and silver bullion and 2½ tons high-grade concentrates, from a reduction of 2000 tons of ore. The new

960-ft. shaft has been timbered to 700 level and is said to be the best executed piece of similar work in camp. Timbering will be extended to bottom as rapidly as possible.

The Oaks Co. is making another shipment to custom mill of ore from Clifton mine obtained in course of development. North and south drifts at 50-ft. level on Eberle mine are also yielding mill ore. Both of these properties are on the Queen vein.

At the Pacific mine, the ore bins are being filled and aerial tramway to Socorro's mill will be started this week and regular daily shipments maintained. A test run of the tram was entirely satisfactory.

Louis Gramas, who is conducting development work on his Gold Eagle group in north-central portion of camp, reports the presence of 3 ft. of pay ore in face of tunnel, and another shipment to custom mill will be made as soon as burros for its transportation can be secured.

Tuscarora.

Driving of the main tunnel at the New Tuscarora mine is approaching interesting ground and should intersect the first of several ledges within 75 ft. It is at present in 320. Some rich gold-silver ore has been taken from the mine, but little deep work has ever been attempted. Utah people are largely interested.

OREGON.

Sumpter.

It is probable that the Golden Chariot will operate through the winter months, according to O. E. Conner, Jr.

Since early spring I have been drilling on the vein with an electric core drill, and the results are rather encouraging. The winze we are sinking from the 200 level is still in free milling ore carrying good values.

SOUTH DAKOTA.

Custer City.

The Gladiator group is being thoroughly sampled on surface and underground with a view to reopening the property.

Customs ores are to be taken in by the Trojan Co. A 3-rail railroad convenient for either narrow or broad-gauge cars of the C. & N. W. or C. B. & Q. is to be built. On this track will be a scale for weighing the lots. From the cars the ore will drop to underground pockets and then be fed to a crusher, and next to a mechanical sampler. It will then drop to underground bins, which are old stopes, of several thousand tons' capacity. This equipment will cost somewhere between \$12,000 and \$15,000. At the mill, additional capacity will be secured by remodeling the slime department. This will include a tube-mill, classifier, thickener, agitators, and revolving-drum filter. The plant's daily capacity is now 350 tons.

The New Puritan Mining Co. has been formed to operate the Puritan mine. John McGoffin is general manager and J. R. Russell is secretary, both being residents of Deadwood, S. D.

Ore is being hauled by teams from tungsten mines of the Homestake to the Star shaft. Here it is crushed and passed to a belt-conveyor, from which the high grade is picked and the low grade fed to a 5-stamp mill. In front of the battery is a short amalgamating-plate where some free gold is saved. Concentration is accomplished on a Wilfley sand-table and two Deister sliming tables. About 20 tons per day is treated. The ore contains enough gold to reimburse the company for all expenditure of its milling and mining, thus leaving the tungsten concentrate as clear profit. The tailing from the mill goes to the cyanide department. At the company's fine grinding plant 3 new tube mills are to be installed. This will double the capacity of the unit, and permit of the grinding of all of the sand originating in the stamp mills. In addition to the extra saving by amalgamation, the reground product passes over amalgamating plates.

Increased extraction has been noted at cyanide plant No. 1, where the sand is treated by leaching. The company feed to this plant a sand just as fine as it is possible to leach within reasonable time.

UTAH.

Midvale.

The new blast furnace of the U. S. Smelting & Refining Co. has been completed and announced a success by C. F. Morse, consulting engineer, Boston. This is the 6th furnace to be blown in at the plant of the type for handling silver-lead ores. The furnace will handle 240 tons per day. About 200 employes have been added to the payroll, making 800 men in all. The company, at a cost of \$20,000, has just completed a brick thaw house, a structure large enough to hold an entire trainload of cars. It is heated by the direct fire system and is used to thaw out the frozen ore from Bingham during the winter.

Alta.

A shortage of teams for hauling ore is curtailing operations at the South Hecla, where 60 men are now being employed. There are 3000 tons ready. The road down Little Cottonwood is icy in places, bare in others, making it not good for either wagon or sled. A fall of snow and the production could at once be increased to 50 tons daily.

South Hecla Extension has two shifts driving the main drift. The raise is retimbered 70 ft. Some ore is being extracted and a car of silver-copper ore is ready for shipment. At the Alta Germania the Dominic tunnel is in 235 ft. It is approaching the Germania fissure, and the face is heavily mineralized.

The tunnel at the Big Cottonwood Bonanza is now in 280 ft. The full face is in the material from which samples were taken, and assays show 3.3 ozs. silver, with a trace of gold. The formation is of such a character that in the opinion of experts the increasing depth gained with the advancement of the tunnel will lead to enrichment of values.

Bingham.

At a recent meeting of Bingham Amalgamated W. P. Davis was made general manager and work under company management will be started. The first work will be from the incline shaft, which is down 600 ft. At the 300 level some drifting has been done. This work will be taken up and one of the drifts continued to the limestone contact. In the adjoining Congor, ore is coming from this limestone, and it is said that the Congor has proven ore up to the Bingham Amalgamated lines on three levels. A drift on the 300 level is out 60 ft. south. This work is in the quartzite. A raise is in the porphyry. The new work will run back into the limestone, which has never been prospected.

At the Silver Shield the winze from the Snowstorm tunnel is down 50 ft. and the 15-in. vein, which was followed is now being opened for stoping in this the Beal lease. They are saving a considerable tonnage from a stope in the tunnel 70 ft. above the Snowstorm. Engineers say that the ore showing is a continuation of the enrichment found in the Highland vein in the Shield's deep tunnel, 750 ft. lower on the dip of the vein. The company's force is mining a splendid quality from the Highland on and just above the lower tunnel level. In the back vein, which contains many large bunches of first class in a mass of milling ore, lessees are making a good saving of the better grade. Work in this part of the mine is retarded by the bad air due to insufficient ventilation. Plans are in order for the sinking of an air shaft from surface.

Eureka.

The new Tintic Standard shaft is down 145 ft., the work having been done with a prospecting outfit, according to Manager Raddatz. About 5 ft. are being made a day but this will be increased soon when the new electric hoist is installed. The ore on the 1300 level is 100 ft. wide and as yet no permanent walls in sight. Arrangements have been made to put in sill floors preparatory to larger operations. The ventilating pipe was found to be inadequate for the new blower, and this will be replaced. The ventilating apparatus

has been found necessary to overcome the gas and heat, which clog the deeper levels on stormy days.

The shaft at the Eagle & Blue Bell is down 2010 ft. It is expected to carry it down to the water level which is about another 50 ft. The shaft sinking is given secondary consideration as there is no hurry now to reach its maximum depth. Important developments from the new station above the 2000 are being pushed. The tonnage is being increased gradually and the company is making good profits. While some of the ore occasionally runs high the mine is maintaining grades which average close to 15 to 30% lead and 15 to 30 ozs. silver.

Park City.

For the past few weeks New Quincy has been shipping at the rate of 2 cars a week. The two faces being worked are 60 ft. apart. The west face assays 0.8% lead, 44 ozs. silver, and 60 cts. in gold. The east face shows 0.97% copper, 6.8% lead, 40.2 ozs. silver, and 60 cts. gold. The body being developed is reached by a raise 280 ft. above the 900 level of the Daly-West. The ore is along the same ore zone as that in which the old Quincy developed a body of ore that yielded more than a million in 15 months.

Machinery for the Judge smelter is continually arriving and C. H. Hansen, head of research work for the General Electric Co., is on the ground with respect to electrical installations. It is expected that the plant will go into operation during January.

Serious caves have occurred in the Ontario shaft affecting the operations of the Federal Leasing Co. The trouble is above the 600 level. The pumps are still working, and from those in charge no fear of a shut down is expressed.

WASHINGTON.

Spokane.

The Silver Mountain Mining Co., capitalized for 1,500,000 shares at \$1 each, has been organized by Spokane men to take over and operate the holdings of the Daisy Mining & Milling Co. and the Wahkiagin Mining Co., near Daisy. W. E. Seelye, Spokane, is president and general manager; Dr. Don Hunt Shephard, Coeur d'Alene, Idaho, is vice-president; Boyd Hamilton, Spokane, is secretary-treasurer, and Charles H. Goodsell, Spokane, deputy U. S. Mineral Surveyor, is consulting engineer. The two groups adjoin, and to date there have been about 3500 ft. of underground run, opening the property to 450 ft. vertical depth. The ore is a low-grade silver. It is anticipated that shipments will begin next spring, a wagon road having been constructed to Addy, 16 miles distant, the nearest railway point. In recent weeks 2 cars of sorted ore have been shipped to the Northport smelter, and a third car now is being assembled. The group has been operated intermittently for the last 25 years; Seelye expended \$50,000 in development, and an equal amount was contributed by the late J. J. Browne. Seelye and the Browne estate are the principal stockholders, but a number of fairly large blocks of the issue are held in the east and middle west.

In the last few days two important strikes have been made in the Electric Point mine, near Boundary, according to Roy Young, president of the Electric Point Co., who arrived in Spokane from the property Thursday. "The existence of these bodies was known to the company, but they lacked development," said Young. "The point of last exposure is at the 200-ft. depth, where the bodies are up to the general average in dimensions and qualities of the other chimneys, of which five or six have been opened. One thousand tons of ore are on the dump, but it is not to remain, a carload of sleds having arrived for its transportation. Ore hoisting was halted for 10 days because of the volume in dump. This lot is composed of 300 tons of high grade and 700 tons of the 25% grade. We will haul 100 tons of ore a day when the roads are good. A tunnel is to be driven at the 300-ft. depth for the removal of muck, thus leaving the shaft free for the hoisting of ore only. A raise on the No. 3 chimney is 120 ft. above the 200 level. A 35-hp. compressor is being installed in place of a machine that was too light for our demands. We have a geological novelty in the form of an

igneous body in lime, an occurrence not considered possible by some authorities. It was struck recently at the 100-ft., depth in a body 4 ft. wide and is expected to lead us to other and interesting conditions."

WISCONSIN-ILLINOIS.

Highland.

New ore buying interest has appeared in this district, by the National Zinc Co. of Springfield, Ill. High grade zinc carbonate has found a market with this firm. Shipments were made last week by independent operators as well as to the Eagle-Picher Lead Co., Collinsville, Ill. Two cars came from the Saxe-Lampe mine; New Jersey Zinc Co. to Mineral Point, 1 car and Kreul Mining Co. to Linden Zinc Co., 1 car.

Whitson Junction.

Chas. Singer, General Manager of the Linden and Cuba zinc ore refineries, with A. P. Craft, an official of the Frontier Mining Co., are promoting the erection of a new custom refinery to cost \$25,000. Dings and Campbell types of magnetic separators are to be installed.

Mifflin.

Twenty-one cars of zinc ore were shipped last week, higher prices enabling independent operators to unload surplus and current production. The M. & A. Mining Co. operating the Big Tom, with new rig are now shipping regularly. The Vinegar Hill Zinc Co. have introduced another new zinc producer on the Yewdall lease with new equipment. Adjoining lands have been drilled and a heavy shipper is predicted. The Peni mine from which no reports have been made on shipments this year has entered in contract arrangements with the Grasselli Chemical Co. The Coker mines shipped 10 cars of zinc ore last week, 8 going to Mineral Point for separator treatment and 2 of high grade to the smelter at DePue.

Dodgeville.

The Guthrie Mining Co. shipped 2 cars of zinc ore last week to the refiners at Galena, 75 tons. The Berryman property recently drilled is offered for sale by the lessee, Henry Robberts. Heavy deposits of zinc ore have been located at a depth of 40 ft.

Montfort.

A slide in the east drifts of the O. P. David mine, following seepage of surface drainage has been overcome and shipments resumed, 1 car going to Wisconsin Zinc Roasters, 40 tons.

Platteville.

Deliveries of zinc ore for week of Nov. 25 totaled 31 cars, 5105 tons. The Mineral Point Zinc Co. offered a good market to independent low grade producers and sharp competition developed. Three cars of lead ore cleared, 2 coming from the Block-House mine and 1 from the Coker at Mifflin. Shipments of iron pyrites were light, in the face of advances in price only 624 tons reached the track. The gross recovery, mine run for all producers reporting, was 4057 tons. Net to smelters including 20 cars, 785 tons, to Grasselli Chemical Co. under contract, 2787 tons. Higher prices and steady advances have inspired ore refiners to hold their finished product. The Mineral Point Zinc Co. shipped 18 cars of refinery jack to the smelter at DePue, 636 tons. Shipments from local producers last week were light, 6 cars in all clearing 244 tons.

Prices on blende showed substantial gains, the base for 60% ore holding at the close of the week at \$98 per ton, with premium grades in advance of \$100. The range was narrowed on medium and second grade ores to \$95, stimulating all independent producers to unload and no reserve ore was found in the field at any point at the close of the week. Lead ore was sold at \$90 outside interests bidding strong. The feature of the pyrite market was a doubling in prices, offers going as high as \$10 per ton.

Benton.

Shipments of zinc ore last week were the lightest for any single week in months, 44 cars reaching track for a total

of 3,702,000 lbs. Frontier Mining Co. held the lead on shipments, 9 cars going to track, 362 tons; Vinegar Hill Zinc Co., 8 cars to Cuba, 356 tons; Fields Mining Co. to Grasselli, 5 cars, 181 tons; New Jersey Zinc Co., 6 cars to Mineral Point, 250 tons. The Skinner roaster sent 10 cars of 59% refinery to the several high grade buyers including the Eagle-Picher Co., 426 tons. New producers with new equipment have been introduced at the Hird and Grotkin mines for the Frontier Mining Co. On the Longhorn for the Wisconsin Zinc Co. A new mine and mill come into active commission early in December for the Vinegar Hill Zinc Co. on the Meloy land. A new mine is being developed on the Copeland for the Wisconsin Zinc Co. and a mill will be supplied early next spring. New Jersey Zinc Co. is developing a new range on lands adjoining and a part of the Meloy estate. Little Giant Mining Co. offer their mine and surface establishment for sale.

Shullsburg.

Shipments have been resumed at Oliver Mining Co.'s plant after installing new roasters, 2 cars high grade going to Edgar Zinc Co. last week, 74 tons. Winskill to Wisconsin Zinc Roasters, 3 cars, 127 tons. A new milling plant is being built for the Rodhams Mining Co.

Galena.

The quality of producer found at the Black-Jack mine, one of the New Jersey Zinc Co.'s, was shown last week, 8 cars going to refineries at Mineral Point, 300 tons. North Unity to National Works, at Cuba, 4 cars, 165 tons. Shipments of high grade refinery product were light the Wisconsin Zinc Co. sending 3 cars to American Zinc Co., 106 tons.

Returns from nearby districts were indifferent on reports handed in for week of Oct. 28. Hazel Green, usually heavy on raw ore shipped 3 cars from the Lawrence mine 120 tons. Shullsburg usually reporting to Winskill, showed no returns last week but instead came 3 cars ore from the Oliver Mining Co. operating the Mulcahy mine to Galena Refining Co. This shipment proves the Galena Refining Co. does not propose to lay down on operations although notice was served by the city of Galena to abate the nuisance of sulphur fumes. One car of high grade product was shipped to Lanyon Zinc Co. 40 tons. Black-Jack to Mineral Point 4 cars mine run, 159 tons. Birkbeck to Joplin Separating Works 3 cars, 132 tons. Graham mine, of Vinegar Hill string, to Cuba 4 cars, 152 tons. North Unity 2 cars, 878 tons. Wisconsin Zinc Co. finished product to M. & H. Zinc Co., LaSalle, 160 tons.

Potosi.

The Wilson Mining Co. reporting steadily shipped 1 car 59% wets last week to LaSalle, 40 tons. Forty-five men are engaged and 275 tons of rock handled daily. A new derrick and hopper at the Trego shaft is being built and when finished will enable a 24-hour run at the mine. A stope is to be taken up 600 ft. long, 150 ft. wide and 20 ft. high. Thirty acres of the leasehold have been fully proven. It is aimed to handle 400 tons daily at the mill. Miners' cottages are being constructed and plans have been drawn for a new boarding house to care for 30 men. The Tiffany Zinc Co. to the east of the Wilson mine is rushing building operations on a 300-ton plant from which service is expected within 15 days. The ore in this district is all high grade as it comes from the jigs and no separating facilities will be required. In addition a fair recovery of lead ore is made in concentrating at all the mines developed here the past year.

Your correspondent was in error in stating that A. B. Paterson was general manager of the Chicago Zinc Co. W. N. Tiffany occupies that position and also owns one-half interest in the company.

Wilson Mining Co. is outputting steady and well-maintained production, a car going in last week to LaSalle, assaying 59% and calling for top price, for mine run stuff.

A new derrick and hopper are going at the Trego mine for the Wilson Mining Co. When this is complete it is proposed to operate the mill 24 hours each day. A stope 20 ft. high, 600 ft. long and 150 ft. wide is waiting to be taken up; 30 acres of the lease have been fully explored and it is proposed to handle 400 tons of mill rock daily. A. L. Manass, formerly superintendent of the Fields mines at Shullsburg,

is now in charge of the Wilson mines. Another car of high-grade blende was shipped last week to LaSalle, 45 tons, and in addition one 25-ton car of lead ore cleared. The Wilson has been a good dividend payer, but its best profits are yet to come. Near the Wilson a new 300-ton mill is in course of construction for the Tiffany Zinc Co., recently incorporated. Much prospect work with drills is being followed in this section with good results.

WYOMING.

Conroy.

The mines of the defunct United States Coal Co. are to be reopened by the recently organized Wyopa Coal Co. P. J. Foley, Pittsburg, Pa., will have charge. The new company recently borrowed \$800,000 for the purpose of pushing the project. The setting in of winter, with the accompanying excessive demands for coal, has hastened the opening of the mine. While labor is unusually hard to secure at this place, it is said that Foley has made arrangements in the east to place more than 100 men at work immediately.

Casper.

The Merritt Oil & Gas Co. has brought in a well in the deeper strata on Section 10 ground. There is 1,000,000 cu. ft. of gas escaping from this oil well every 24 hours and steps are now being taken to construct a pipe line and save the gas. After the drill penetrated the sand to a depth of 10 ft. tremendous pressure was caused by the escaping gas. For an hour after the ten-foot point had been reached the oil continued to raise until more than 1000 ft. of oil raised in the well. This shows the producing capacity of which the sand is capable. Enthused by this showing Midwest expects to start for the deeper strata on ground of the Elkhorn Co.

CANADA.

BRITISH COLUMBIA.

Silverton.

To provide its equipment with more power, the Standard Silver-Lead Mining Co. is installing a new high-power crude oil engine in its mill at Silverton. During the cold period lack of energy has necessitated curtailing the output for a number of years, but with the additional power it is believed that capacity operations can be maintained steadily. Ice forming in the flume that furnishes the mill caused a shut down at the property a few days ago, but activity will be resumed as soon as the plant, in continuous operation for many months, is overhauled. Use of new machinery in connection with the flotation and concentrating plant, and the desirability of making provision against temporary cessation of hydro-power supply are reasons given for putting in the oil engine. Development of the recent strike in the lowest level of the Echo mine at Silverton has opened the ore body to a width of 11 ft. without reaching the limit, according to J. H. Thompson, manager. The property, which adjoins the Alpha claims of the Standard group, on which a 16-ft. ore body is being worked, is owned by Spokane men, including John Jordan and L. J. McAtee.

Nelson.

The Norman Mines Co. of Spokane, of which James A. Welch, railway construction contractor, is president and general manager, and Sidney Norman, mining broker, is secretary-treasurer, has taken a lease and bond on the Madison group, on Reco mountain, near Nelson. The bond is for 3 years at \$25,000, with \$5000 due payable June 1, 1917, \$10,000 March 1, 1918, and \$10,000 Dec. 1, 1918. Andrew G. Larsen of Spokane is consulting engineer for the company, and he already has a force at work cleaning out the workings preparatory to an extensive examination. This group consists of four claims, the Madison, Argenta, Great Eastern and Mardon, lying north and south on Reco mountain in line with the vein systems of the Noble Five, American Boy and Last Chance properties, which have produced large tonnage of

high-grade ore. W. F. Kennedy, Ralph Clarke and H. B. Nichols of Spokane, sold this property 20 years ago to W. C. Price of San Francisco, who transferred it to the Slocan Sovereign Mines, from which the Norman Co. gets it. Five tunnels, the lowest and longest being 1100 ft., have developed these properties and opened the vein to a depth of 300 ft. Picked samples have run as high as 2000 ozs. silver. Several streaks of high-grade ore in levels No. 4 and No. 5 will be developed.

ONTARIO.

Colbalt.

It is noted in the company report of Nipissing that the company mined ore valued at \$233,646 and made shipments including customs ores totaling \$410,233 during October. Important development was the continued good results obtained in four raises on vein 490 at the 5th level. The average is 50 ft. above the level. Usually there were two or three veins in each raise and during the month the average of all four was 6, assaying 1000 ozs. Some of the raises have shown as high as 10 ins. assaying 1800 ozs. In addition to high grade the raises are producing a good grade of mill ore. Indications are that a future stope on this vein will have an average width of 8 or 10 ft. At present, three of the raises have encountered a local fault, which from past experience throws the vein 6 ft. It is expected that the portions of the vein above the fault will be approximately the same as those found below.

The shaft at Lorrain Con. which will be sunk to the 400 level, is now down 300 ft. The company have planned extensive exploration which includes about 1400 ft. of drifting from the 400. The company resumed work in the summer and have added 200 ft. to the former depth of the shaft. The shaft was sunk on an 8-in. vein, carrying smaltite and some nickelite. The vein dipped out of the shaft at 65 ft. but will be again reached in a crosscut from the lower level. Engineers have recommended exploration work near the contact.

Gowganda.

Though no railroad as yet has been built or contemplated for this camp development continues with a small production. At the Miller Lake-O'Brien it is said a find was made on the 325 level. Little can be learned of it since the ground is privately owned. The vein, which has already been drifted on for 150 ft., shows a width in some places of 39 ins. A fair average is put at 2 ft. The ore in this is said to average 5000 ozs.

Crews-McFarland installed a 5-drill compressor and are continuing the shaft from the 100 to the 200 level. The plans of development outlined call for crosscutting and drifting at the lower level. The company have some excellent surface showings.

On the Mapes-Johnson ore has been developed on three levels. A shipment is now being prepared, to be sent out over the snow. Drifting is under way on the 378 level and the face of the drift is in good ore, the same vein being on the 265. The company is equipped with a 3-drill compressor, a hoist, buildings, etc.

Kirkland Lake.

Installing new machinery at the Lake Shore Gold Mines Ltd. has been completed. The new compressor has a capacity of 740 cu. feet, and operates 7 drills. It can be operated either by steam or electric power. For the present it will be driven by steam until the Northern Ontario Light & Power Co. complete the power transmission line. The hoist is 10 by 12 ins. It is adequate for hoisting 1000 ft. Power is furnished at the present time by a steam plant of 160 hp. The shaft is down 300 ft. Considerable development work has been done on the 100 and 300 levels. About 400 ft. of drifting has been done at the 400 and 250 ft. of this in ore. At the 100 the shoot is shorter and about 120 ft. is in ore. All work has been done to the west of the shaft. An 800-ft. diamond drill hole was sent under the lake and several veins were located. Later crosscut will be run to these. At the 200 level it is proposed to do some work on a drift under the lake. A new mill has also been proposed and the site selected.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 3.925 fine.

Copper.—Tenseness in the copper situation has been replaced by conservatism in the past week. Under the guiding hands of the prominent producers the copper situation has developed to such a point that nothing can take place that would have a repressive effect on the future prosperity of the red metal. Under their guidance the furious buying has terminated. They have held down on consumers who sought to cover needs over all of next year. They have talked conservatism and preached about the ill effects that a runaway market would have. They have cautioned consumers against overbuying. They have, finally, told their regular domestic customers that their future requirements would not be overlooked or would foreign purchases be given any preference. It has only been by these means that the producers have been able to restore confidence in the situation. Many consumers thought that the producers were after their pound of flesh and that the time had come to cast off business acumen and take copper for whatever delivery it could be had and at whatever price was demanded. Naturally the continuance of such a state of affairs would act to undermine any market, therefore the producers struggled to stave off this calamity. That they have succeeded is evidenced by the less active demand for copper.

Business since our last report taken by dealers and producers amounted to about 130,000,000 lbs. Of this aggregate less than 10,000,000 lbs. was for delivery after the first half. Producers have stopped selling for third or fourth quarter delivery. The dropping of the French inquiry for 225,000,000 lbs. for second half delivery reflects their attitude. While it was stated that this matter never reached the stage of formal negotiations it is known, however, that the buyers abandoned the plan on instructions of leading copper factors who realized just what condition such a sale would lead to. Domestic buying continued along lines that indicated the covering of nearby and second quarter requirements alike. Some consumers took December and January metal. Others ordered first quarter delivery, while a substantial business was done for the second quarter. Producers did not partake in the nearby business, confining their sales to second quarter and in a few instances disposing of metal for the third quarter. Prices have now reached a level at which they are likely to remain for several months, that is until

the next wild buying movement sets in, unless producers feel that present values are the top. Spot electrolytic sold at the new high record price of 36½ cts., but only a small tonnage was involved. Spot lake sold at 35 cts. Electrolytic for December delivery sold in carload lots at 34¾ cts., while dealers took orders for the first quarter at 33½ cts. with business for the second quarter done at 32½ cts. For the third quarter some sales at 31½ cts. are known to have been made. Casting copper for March delivery sold at 32 cts., while one of the important eastern producers of this grade is declining to quote.

The course of the London market has been distinctly upwards. Spot electrolytic has climbed up to £168 and three months delivery of this grade up to £165. Standard copper has advanced to £147 for spot and £141 10s for futures.

Quotations for copper per pound at New York for the week ended Nov. 29 were as follows:

Tin.—The scarcity of spot tin has not been relieved in the past week and, while prices are about a half-cent off from the top this is due to profit-taking by small holders. Spot Straits sold at 45¼ cts., an advance of almost 4 cts. since the beginning of the month. Spot Banka sold up to 45¼ cts. Present prices are 45¼ @ 45½ cts. for Straits and 44¾ cts. for Banka.

London and Singapore advanced last week, but during the current week the markets have shown irregularity. On Thursday Singapore touched £196 and Straits tin at London £191 10s.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Nov. 29 were as follows:

	New York		London.	Singapore
	Spot.	December.	Straits spot.	shipments.
Nov. 23.....	45½c	45¼c	£191 10s	£196

Lead.—A very good business has been done in lead by leading independent producers at rising prices. Although outside interests took good orders it was noted that a tendency existed to hold down sales until the A. S. & R. Co. took some action on its price. Independents sold lead for December delivery at prices ranging from 7.25 to 7.30c. Naturally the quotation of 7.60c New York of the A. S. R. Co. is out of line. Some lead factors believe that an advance of \$10 a ton will be announced with the turn of the month and 8 cts. for lead is predicted by the end of December. Domestic consumers were the principal buyers. As yet the Canadian and Far Eastern interests have not entered the market. Lead for early December delivery is very scarce. Some producers are pretty well sold up, which is another factor in carrying prices to higher ground.

At London the situation has not undergone any change, the government maximums prevailing.

Quotations for lead per pound at New York and per ton at London for the week ended Nov. 29 were as follows:

	New York		London	
	Indpts.	A.S.&R.Co.	Spot.	Futures.

Lead Ore.—In the Missouri-Kansas-Oklahoma district during the week ended Nov. 25 prices for the best grades were up to \$90, while the poorer grades dropped \$3 to \$82. The shipments made during the week were up to 2,258,570 lbs. valued at \$98,532. The total for the year was placed at 93,007,522 lbs. and this amount was valued at \$3,858,974.

Zinc Ore.—Prices were up again during the week ended Nov. 25 and the better grades sold at \$105 with the price for poorer grades ranging down to \$97.50. The week's shipments amounted to 16,405,350 lbs. valued at \$783,808, and the year's shipments to date were 635,341,737 lbs. valued at \$25,464,921.

Calamine.—This ore was also higher and sold at from \$62 to \$46. The week's shipments amounted to 2,046,210 lbs. valued at \$54,837, and the year's shipments to date amounted to 35,452,115 lbs. valued at \$1,057,959.

Spelter.—Demand for prime western spelter for first quarter delivery has been quite active, with further price advances. Buying has come mainly from domestic users. While some business has been done for the second quarter there appears to be no decided effort to cover needs over that period. Brass special has been in very good demand, spot moving up to 14@14¼ cts. St. Louis. Spot prime western advanced to 13½@13¾ cts. New York, and 12¾ @13 cts. St. Louis. A fair business for December delivery was done at prices ranging from 12½ to 13½ cts. For first quarter delivery sales were made from 12½ to 12¾ cts. St. Louis. Second quarter delivery held around 11¾ cts. Although prices are much higher than before the buying movement began, some producers of spelter remain out of the market, asserting that still higher prices are to be obtained. With zinc ore selling at \$105 a ton at Joplin, spelter below 14 cts. is cheap. It is apparent nevertheless that producers in their plan to secure higher prices are holding back metal and are depending on their past earnings to support their actions. On the other hand production of spelter has not reached the record-breaking figures that were indicated in the capacity report several months ago, as many of the retorts were not fired.

At London the situation has not shown any essential change, prices moving in narrow channels. Exports of spel-

ter are unusually heavy, shipments of 13,134 tons being reported since the first of November.

Quotations for spelter per pound at New York and per ton at London for the week ended Nov. 29 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—A reduction of \$2.00 a flask has been made in spot virgin quicksilver, sellers stating that demand was inclined to be dull and with supplies arriving steadily it was impossible to maintain the price at \$80. Offerings are now being made at \$78 per flask, but even the lower price has failed to attract business.

Tungsten.—Demand for tungsten has been very active with sellers reporting a considerable business done for delivery over all of next year at prices ranging from \$17.50 per unit for ordinary grades to \$18 per unit for high grades. Eastern buyers have been especially anxious to take on tungsten for forward requirements. The situation in this metal is clouded. In the first place there are some interests who would like to see tungsten go up above \$50 a unit so that they can carry through stock selling schemes. Then again there are some speculators who bought tungsten when prices were high without thought that increased production would furnish a corrective. These individuals are holding metal for higher prices. On the other hand there are some producers who are finding that present market values yield a good profit and, being the principal outputters, are in a position to hold the market down. Brazilian ores are going direct to Europe while Japan has placed restrictions on shipments.

Sheet Zinc.—Further advances have been announced in sheet zinc, the price going to 22 cts. base with the usual 8% discount. Since the first of November five advances have been announced.

Antimony.—The situation has neither improved or weakened since our last report. Some Chinese and Japanese interests being well sold up are holding spot at 15 cts. Dealers on the other hand are willing to sell at 14 cts. duty paid. A fair sized Canadian purchase for nearby delivery has been put through, but otherwise business has been limited.

Pig Iron.—Basic iron has sold at \$30 valley and bessemer at \$35 valley, while foundry grades have advanced \$1 a ton and in some cases more. The demand for pig iron has been very heavy and sales in all districts last week amounted to over 175,000 tons.

Ferro Manganese.—Buying has been quite active lately with a number of good sized inquiries now in the market. Domestic producers have secured all of the business at \$164 delivered while English makers have been asking that price at the seaboard. It is intimated that English makers will soon lower their prices.

Iron Ore—			
Bessemer, old range, ton.....			5.95
Bessemer, Mesabi.....			5.70
Non-Bessemer, old range.....			5.20
Non-Bessemer, Mesabi.....			5.05
Lead—Granulated, lb.....	.14½	to	.15¼
Brown sugar.....	.11½	to	.11¾
White crystals.....	.13	to	.13½
Broken, cakes.....	.12½	to	.13
Powdered.....	.13¾	to	.14
Litharge, American, lb.....	.09	to	.09½
Mineral Lubricants—			
Black summer.....	.13½	to	.14
29 gr., 15 c. t.....	.14	to	.15
Cylinder, light, filtered, gal.....	.21	to	.26
Neutral, filtered, lemon, 29 gr.....	.37½	to	.38
Wool grade, 30 gr.....	.19½	to	.20
Paraffin—High viscosity.....	.29½	to	.30
Naphtha (New York)—			
Gasoline, auto.....	.22	to	.24
Benzine, 59 to 62°, gal.....	.28	to	.28½
Nickel Salt, double.....	.08	to	.08½
Single.....	.11	to	.11½
Petroleum—			
Crude (jobbing), gal.....	.15	to	.18
Platinum—Oz. ref.....	105.00	to	111.00
Potash Fertilizer Salts—			
Kalnit, min. 16% actual potash.....			32.00
Muriate, 80 to 85%, basis 80%, ton.....	450.00	to	475.00
Refined, bbl.....			.12
High grade sulphate, 90 to 95%, basis of 90%.....	400.00	to	450.00
Hard salt, man., 12.4% actual potash.....	Nominal		32.00
Potassium—			
Bichromate.....	.40	to	.42
Carbonate, cal. 96 to 98%.....	1.30	to	1.35
Cyanide, bulk, per 100%.....	.80	to	1.00
Chlorate.....	.64	to	.70
Prussiate, yellow.....	.95	to	1.00
Prussiate, red.....	2.50	to	2.75
Salt peter—Crude, lb.....	.12	to	.14
Refined.....	.31	to	.31½
Soda—Ash, 48% (43% basis), bbl.....	3.00	to	3.60
Strontia Nitrate, casks, lb.....	.28	to	.30
Sulphur—			
Crude, ton.....	28.50	to	29.00
Roll, 100 lbs.....	1.95	to	2.25
Tin—Bichloride, 50°, 100 lbs.....	.14¼	to	.14¾
Crystals, bbls., lb.....	.29	to	.29¾
Oxide, lb.....	.43	to	.50
Zinc Chloride.....	.10¼	to	.11¼

Methods of Softening and Filtering Mine Water

M. F. NEWMAN.

One-sixteenth of an inch of scale in boiler tubes will cause a waste of 5% or more in fuel burned. As the scale increases, the loss in fuel increases. Frequent cleaning of the tubes is necessary with consequent shutting down of the boiler. Labor is required, which costs money. The tubes are injured by the scale, meaning increased maintenance.

These things are not new to those who operate boilers in hard water districts. In fact, so far from being a subject on which new things can be said, the

do it, and the item of fuel cost is as important with him, dollar for dollar, as in any other industry.

Water is hard because it carries in solution certain mineral substances, and through heating in the boiler tubes, the latter are made the dumping ground of these impurities. The substances in solution are principally the carbonates of lime, magnesia and iron, and the sulphates, chlorides and nitrates of lime, magnesia and iron.

Without going into the chemistry of the subject,

SOFTENER INSTALLATION, U. S. COAL & OIL CO., HOLDEN, W. VA. (BOILER FEED AND MUNICIPAL).

SECTION OF TUBE FROM A BADLY SCALED BOILER.

boiler scale nuisance is so old as to be rather a habit with some—a supposedly necessary evil which has to be tolerated, and about which the less said the better.

But neglecting to remove from the water those impurities which cause scale, with attendant fuel loss and deterioration, is in reality largely a matter of inertia on the part of the average power plant operator. He is not alone in his proneness to do things the way he has always done them. But with evidence on every hand, in industrial power plants, that water can be treated easily and cheaply so as to remove scale-forming impurities before it gets to the boilers, there is every reason why mine owners should look into this subject. His profits depend not alone upon how much he can take out of the ground, but how cheaply he can

it is sufficient to say that these impurities, which are not visible to the eye, can be removed by adding to the water chemical reagents, such as lime and soda ash, which will cause the impurities to become insoluble and be precipitated. This treatment may be given in a simple automatic machine called a water softener. The precipitated impurities settle harmlessly to the bottom of the softener tank, and the softened water is then filtered and delivered to the heater and boiler.

A safe rule to follow in purifying boiler feed water is to remove the hardness and suspended matter by means of an efficient water softening and filtering system, whereby all suspended matter originally in the water, as well as the precipitate resulting from the

softening reaction, are removed, so that the water is both clear and soft.

The mechanical details of water softening devices vary with the different manufacturers, but for the purpose of illustration, some of the apparatus made by Wm. B. Scaife & Sons Co., of Pittsburgh, Pa., has been selected.

Water softeners are made both intermittent and continuous in their operation.

The intermittent system consists essentially of two or more treating and settling tanks, equipped with mechanical stirring devices, operated by power, a reagent or chemical mixing tank with mechanical stirring device, with means for introducing the chemicals into the treating tanks, and one or more filters of either gravity or pressure type. The settling tanks are filled alternately with water. While a tank is being filled the chemicals are introduced and thoroughly mixed with the water. The softened and settled water is taken out of the settling tank by means of a hinged

SOFTENER, CONTINUOUS SYPHON SYSTEM, THE FUCHS & LANG MFG. CO., RUTHERFORD, N. J.

floating outlet pipe arranged to rise and fall with the level of the water. While one tank is being filled, treated and settled, the other tank is supplying the softened water through the filter. When this tank is empty, the first tank is ready for use. Thus, a constant supply of clear, soft water is obtainable, although the treatment is made intermittently. In this system measured quantities of water are treated; therefore, accuracy of treatment can be maintained, and uniform, clear, soft water obtained regardless of the variation in the impurities in the water, or the rate at which the purified water is used, as the use of the water has no particular influence on the treating operation. The settling tanks act as storage, in which a considerable volume of water is carried and is available for irregular demands.

A typical arrangement of an intermittent system is shown herewith.

The continuous system consists essentially of a treating and settling tank, with mechanical feeding

device to proportion the chemicals to the flow of water through the apparatus. After treating and settling, the water is delivered through a filter for clarification. In the softening process, the reagents, such as lime and soda ash, are prepared in the reagent tank at ground level. This is a manual task, and is done at least once every 12 hours in most cases, and one man can do it

WE-FU-GO INTERMITTENT SYSTEM WITH GRAVITY FILTERS.

in a short time. This reagent solution is then pumped up into a solution tank in the upper part of the softener. By means of the syphon arrangement of this particular softener, the reagent solution is introduced in direct proportion to the volume of water flowing into the apparatus. This syphon introduction and

SYPHON CONTINUOUS SYSTEM WITH GRAVITY FILTER.

mixing is automatic in its operation, the proportion of reagents added to the incoming water being at all times constant; so that the proper quantity is added to soften the water. The water with the chemical added is mixed in the top of the vertical tank, and the reagent causes the soluble mineral matter in the water to

be precipitated in fine crystalline or powder form. These precipitates settle to the bottom of the tank where they can be readily blown off. The passage of the water through the treating and settling tank is slow enough so that ample time is allowed for precipitation and settling. The softened water is drawn from the tank and piped to the filter, or in some cases is delivered to a filter built in the top of the settling tank. The usual type of filter consists of sand or quartz of different degrees of fineness, with the coarsest at the bottom. The suspended matter is removed in passing through the sand filter, which is so arranged that by manipulation of valves, water can be forced in the reverse direction through the sand, periodically, to wash it.

Two arrangements of a continuous softener are illustrated. In one, the softened water passes through a gravity filter and is pumped into a closed type heater before entering the boilers. In the other, the water passes through a pressure filter and then into an open-type heater, the boiler feed pump being located between the latter and the boilers.

The two types of softeners, intermittent and continuous, have their respective advantages for various conditions encountered as to water supply, method of use, etc.

Review of Conditions in the Jopln Zinc and Lead District in November.

All previous records of this district both in point of tonnage and values for zinc and lead ore will again be broken by the 1916 output, which now looks as though the gross increase over 1915 will be as large or larger than last year's great gain over all previous high records.

For the 11 months of the current year, according to the Lyon Investment Co. review, the production of zinc ore (including calamine) amounts to 670,793,852 lbs., which sold for \$26,522,880. During the corresponding period of 1915 the production was 555,323,525 lbs., which sold for \$20,694,186.

The output of lead ore during the 11 months just ended has been 93,007,592 lbs., which sold for \$3,858,974, as compared with a production of 81,507,115 lbs., that sold for \$2,145,982, during the corresponding period of last year.

The foregoing figures show the value of both ores for the first 11 months of 1916 to be \$30,381,845, as against a value of \$22,840,168 for the corresponding period of 1915, and a total value of \$26,050,350 for the entire year.

Last March it was estimated that the output would reach \$35,000,000. If the average rate of production during the past 11 months is maintained throughout December, this year's output will go slightly above \$34,000,000, but there is more than \$1,000,000 worth of ore now in bins at the mines throughout the district, most of which we believe

will be marketed during the coming month in addition to the regular production, thus bringing the total value close up to our early estimate.

November closed with the price for top grades of zinc strong around \$105 per ton, which was an advance of about \$30 per ton during the month, and \$40 higher than the price in October. The market seems to be following very much the same course as it did in 1915, when a top price of \$130 was attained early in June, from which the market gradually receded to \$70 per ton in August, and then remained practically stationary at \$70 to \$80 until the latter part of October, when a steady advance set in that carried it to \$115 by the end of November, and then fluctuated between \$90 and \$110 until February, 1916, when it reached \$120, then went off to around \$100 until the middle of April, when it sold up to \$125, the top price for the year. During May and June prices were fairly steady at from \$90 to \$110, after which a gradual decline set in that carried the market down to \$65 for top grades during September and October of the current year.

With the certainty that winter weather will curtail production and with every evidence of an increasing demand for spelter, both for munitions and in commercial channels, it would seem as though a strong and high market for zinc ore may be anticipated during the next 6 months.

Extracting Pyrite from Zinc.

In many western ores the presence of large amounts of iron in the zinc concentrate has been a curse to the milling industry, because when iron was above 10% the concentrate might contain as much as \$30 worth of zinc to every ton and yet be unsalable. The method as worked out by the department of metallurgical research, University of Utah, consists of treatment of the mixed sulphides in a reducing atmosphere at about 600° C. The pyrite loses 1 atom of sulphur under these conditions and is reduced to a form which will react with dilute sulphuric acid, while the zinc sulphide is resistant to the acid. In this way the iron can be removed, making a marketable zinc product. The success of the method depends upon the use of cheap sulphuric acid, but at the same time the large smelting interests are at a loss to know what to do with their sulphur fume from the smelting furnaces. The conversion of this sulphur into sulphuric acid is quite cheaply done, but heretofore the trouble has been that there was an insufficient market for the acid. This process of removing iron from the zinc concentrate should prove to be an important consumer of acid, and is only one illustration of how one branch of the Bureau's work may fit in with another, as one section of the bureau has been studying smelter fume problems while up to the present time the Salt Lake station has been devoted entirely to the metallurgy of zinc and lead.

Mascot Copper Co.'s Aerial Tramway.

In transporting its ores from the mine to the Mascot & Western railroad for shipment, the Mascot Copper Co., at Dos Cabezas, Ariz., uses a 10,000-ft. Broderick & Bascom aerial tramway, using patented improved screw type friction grips.

Illustrations show the buckets and loading station. The capacity of the line is 50 tons per hour.

The track cables are $1\frac{1}{8}$ and $1\frac{1}{2}$ -in. B. & B. wire ropes. The B. & B. pulling wire rope is $\frac{9}{16}$ in. in diameter. This tramway operates by gravity. The

TRAM LEADING FROM MINE TO RAILROAD.

longest span in the tramway is 1300 ft. The highest tower is 52 ft.

The copper ore is brought out of the mine tunnel in small ore cars, pushed by hand. These cars are dumped into a small chute leading to the "picking belt," which discharges the ore into the ore bins at the loading station. The loading station has four steel chutes for loading the tramway buckets. These chutes are of the undercut type and are operated by hand.

The ore is then carried by gravity to the Mascot & Western railroad at the recently established town-site of Mascot. The receiving station at the railway is equipped with a discharge bin having five steel

chutes, with pivotal extensions for loading the freight cars.

From this receiving station the ore-laden freight cars are hauled to the smelter at Douglas. The Mascot & Western is about 16 miles long and connects with the Southern Pacific system at Willcox. The Mascot & Western has been in operation since June, 1915.

Mineral Deposits in Eastern Nevada.

Twenty-nine mining districts in eastern Nevada are described in a report recently issued by the U. S. Geological Survey as Bulletin 648, "Notes on Some Mining Districts in Eastern Nevada," by J. M. Hill. These districts are widely scattered through an area extending from the northern part of the state to the extreme southern part, in southeastern Clark county. Not much has heretofore been known about the geologic features of the ore deposits in these districts, because they are relatively inaccessible or undeveloped. Silver, lead copper and gold are the principal valuable metals found, but tungsten and bismuth also are known to occur. Many of the deposits were found in the early sixties, when the rich oxidized ores were worked, but others have since been discovered from time to time, valuable ore bodies having been found as recently as 1911. Most of the ore deposits occur in sedimentary rocks that border intrusions of granite or porphyries. Gold and silver are found in Tertiary volcanic rocks of other parts of Nevada, but only one deposit of precious metal—a free-milling gold ore—has so far been found in such rocks in this region. The report is chiefly a record of facts, most of which are of local and practical interest. It is intended as a guide to those who wish to know something of the geologic occurrence, character, and stage of mining development of the ore deposits in the districts examined.

Reinforced Spiral Pipe Smokestack.

A novel use for reinforced spiral pipe such as that employed by mining companies for water supply, dredging and drainage operations has been found in the manufacture of a stack consisting of pipe 50 ft. long in one piece, which comes from the works of the Standard Spiral Pipe Works, Chicago. It is more rigid and appears to be stronger than any other stack of considerable heavier metal would be. The same company has also recently made up two 20-in. stacks, each 55 ft. long in one piece, with only one set of guy wires. These are now in service and were given a severe test recently when a windstorm passed over the section in which they were erected. All other stacks in the vicinity having two to four sets of guys of the same length, together with telegraph poles, trolley wires, etc., were blown down, while these stacks were not affected in the least.

Leading Gold Mining Operations in Korea

E. W. MILLS.*

Gold mining is of very ancient origin in Korea, going back probably before the Christian era. This branch of mining, however, was entirely alluvial, and it has been overshadowed of late by the development of lode mining under modern conditions. The first concession to foreign engineers was the Morse concession in 1895. Subsequently, concessions were granted to British, German, French, Russian, Japanese, and Italian representatives.

The development of production in recent years has been rapid. In 1895 the output first passed the \$5,000,000 mark, while in 1913 it was valued at \$5,175,000, in 1914, \$5,115,000, and last year it attained the record yield of \$6,145,000.

The following is a short account of the leading mines now operating:

Un-san Concession.—The Un-san mines are situated in North Pyeng-an, about forty kilometres south of the Yalu river. This concession is being worked by the Oriental Consolidated Mining Co., an American company, which has been highly successful in its operations in this district from the beginning.

Operation were first started at Chittabalie, and a 20-stamp mill was placed in operation in 1897. This mill was the pioneer of the modern stamp mills in Korea. Before the mine was abandoned, in 1905, it had produced 152,632 tons of ore, valued at 3,036,952 yen. In 1899 a 40-stamp mill was erected at Tabowie, and in 1907 was enlarged to 80 stamps. To June 30, 1915, this mine has produced 1,226,859 tons of ore, valued at 15,918,755 yen.¹ A 20-stamp mill was erected at Kuk-han-dong in 1900. It was increased to 40 stamps in 1905. This mine was closed down on January 15, 1915, after having produced 551,892 tons of ore, valued at 4,788,182 yen. In 1902 a 40-stamp mill was placed in operation at Maibong. To June 30, 1915, 412,071 tons of ore, valued at 5,967,274 yen have been produced. In 1903 an 80-stamp mill was erected at Taracol. To June 30, 1915, this mine has produced 1,173,208 tons of ore, valued at 13,749,526 yen. There are 16 batteries of five stamps each, and 32 vanners of the Frue type. The daily capacity of this mill is about 350 tons in twenty-four hours. In 1908 a 10-stamp mill was placed in operation at Candlestick. From this mine 43,998 tons of ore, valued at 999,591 yen, have been produced up to June 30, 1915.

As may be seen from the foregoing, the growth and development of this concession has been exceedingly satisfactory. On July 1, 1915, a total of 210 stamps was in operation at the following mines: Tabowie, 80 stamps, Taracol, 80 stamps; Maibong, 40 stamps; E. Candlestick, 10 stamps. The tonnage of ore crushed for the year ending December 31, 1915, was 295,379

tons, valued at 3,758,135 yen. From this ore, gold in bullion and concentrates was recovered to the value of 3,228,941 yen. The total tonnage of ore produced from the various mines since 1897 to December 31, 1915, has been 3,986,772 tons, valued at 49,568,632 yen. The first dividend of 5% was paid in 1903. Since that time to July 1, 1915, the total dividends have amounted to 150%, of a total of 12,871,550 yen.

Su-an Concession.—The Su-an mines are situated some 100 kilometres farther south, about the middle of South Pyeng-an, some kilometres from Chin-nam-po, while the Chik-san mines are situated about the same distance south again in the Province of Kyong-Ki, adjacent to Nam-yang Bay. This British concession is held by the Korea Syndicate, Limited, of London, but is being operated by the Seoul Mining Co. This concession is being developed with highly successful results. Although not as old as the Un-san concession, its tonnage and output are increasing yearly. It shows promise of eventually becoming the largest producer in Korea. The first stamp mill of 20 stamps was placed in operation in the latter part of 1909 at the Su-an mine. This mine developed satisfactorily, and the mill was increased to 40 stamps in the autumn of 1911. During the past three years a larger mine than the Su-an mine has been developed at Tul-mi-chung, about six miles south of Hol-kol. A reduction plant, the pioneer of its kind in Korea, was placed in operation late in September, 1915. This plant has a rated capacity of 350 tons in 24 hours, and is the first one in Korea to use Hardinge conical ball and pebble mills, in place of gravity stamps, for crushing and grinding the ore. Both plants also employ the oil flotation process for the recovery of concentrate. It is expected that the production of gold from the Su-an concession for 1916 will approximate a total of 2,500,000 yen. For the year ended December 31, 1915, the Su-an concession produced 108,078 tons of ore, valued at 1,789,224 yen. The gold production for the same period amounted to 1,435,041 yen. Since the date of the commencement of milling operations in 1909 to January 1, 1916, the Su-an concession has produced 433,361 tons of ore, valued at 7,945,328 yen, with a total gold production of 6,566,244 yen. The dividends for the same period have amounted to a total of 2,180,087.50 yen, or a total of 275%.

Chik-san Concession.—This concession was operated intermittently by the concessionaires, Shibusawa-Asano Mining Partnership on a small scale until 1906. In this year American partners were admitted, and in 1907 a small stamp mill was placed in operation. In 1911 a reorganization took place, whereby the control of the concession rights was taken over by an American company, the Chiksan Mining Co. During the Japanese régime considerable work was done on the

*Excerpts from a paper read before the Korean Branch of the Royal Asiatic Society.

placer deposits, and a small profit was made. Although no exact figures are available, it is probable that the alluvial gold production during this time amounted to over 300,000 yen. For the year ended December 31, 1915, the production of gold from this concession was 933,261 yen. It is estimated that the Chik-san concession has produced 3,199,073 yen in gold, and has treated 192,144 tons of ore during the period from February, 1908, to January 1, 1916. This concession has now reached the dividend-paying stage, and is being operated successfully.

The present company has proved the existence of a large acreage of ground containing sufficient gold to warrant the installation of a gold dredge at Sei-go-ri, which was worked earlier under the supervision of the Japanese concessionaires. The order has been placed for this dredge, and it is expected that it will be in operation before the end of 1916. Chik-san will, therefore, have the distinction of starting the first gold dredge in Korea. The operation of this gold dredge, in conjunction with the present mill of 40 stamps, should result in showing a considerable increase in the gold production for 1916 and for several succeeding years.

Japanese Enterprises.—Under government encouragement an important combination was formed in recent years known as the Furukawa Partnership Co., which holds some 15,000 acres in the Koo-Sung district, North Pyeng-an. The chief interests comprised are those of Messrs. Furukawa, Asona, and Kuhara. In co-operation with this company; the Kuhara Mining Co., of Osaka, lately completed a smelter at Chin-nam-po designed primarily to treat gold-copper ores, more especially the concentrates, from the Su-an mines.

Government Mines.—The Japanese Government has itself retained a number of gold prospects for experimental working in different districts.

In all something like 50,000 Koreans and several thousand Chinese and Japanese are now dependent upon the foreign companies for their livelihood. The author states Japanese authorities are willing to assist foreign mining companies in every possible way. After the occupation of Korea mining regulations were issued in 1906, with further amendments in 1907 and 1908, and a further revision is expected to be published shortly. Henceforth it is provided that "none can enjoy mining rights other than subjects of the Empire or juridical persons organized in accordance with the laws and ordinances of the Empire." It is stated, however, that foreigners who already possess mining rights will not be affected by the revision either now or in the future.

An unprotected bare wire is more or less dangerous regardless of potential, if proper precautions are not observed with regard to distance from rails and location as to chutes and switching stations.

¹Yen = 49.8 cts.

Keeping Metals Hot in the Ladle.

When several furnaces are tapped into one ladle, where it is desirable to refine one material or mixture with others at the same time, or where metallic waste is to be melted, it is of advantage to do these things right in the ladle itself in many instances. In tapping from several furnaces before pouring, especially, the contents of the ladle is apt to become too cool for pouring properly. The contents can be kept hot very conveniently by using an apparatus shown in the illustration.

The ladle is mounted on its car in such a manner that it can be run under two electrodes which can be raised and lowered as shown. Current passing from one electrode to the other through the contents of the ladle generates enough heat to bring the contents back

METHOD OF KEEPING METALS HOT IN LADLE.

to the proper pouring temperature or to melt or refine scrap and other materials thrown into the ladle.

To refine or make additions to the metal collected in the ladle it is introduced into the electric circuit, and the removal of slag proceeded with if required. The current is then regulated so as to considerably reheat the metal to be refined, and the necessary additions are then made to obtain the required quality. For example, steel can be manufactured with cast iron from ordinary cupolas by refining this cast iron by the addition of oxide and, just as in the Martin furnace, one can desulphurize, dephosphorize and deoxidize. This process therefore permits of transforming an ordinary foundry into a steel foundry. C. A. Keller of Paris, France, is the inventor.

Japan's Boom in Metals.—The boom in Japan's metal industry in 1915 appears from the statement of the director of the Mining Bureau of the Department of Agriculture and Commerce that the total value of the mineral output in 1915 was \$87,711,075, exclusive of the production of the Government iron works. This was a gain of \$10,428,620 over 1914. The total value of metals produced amounted to \$17,811,405, or 57% above the previous year's figures. The increase in copper output was 7%, and in value more than 37% over 1914. Antimony output increased 200%, while the gain in value was 8750%. Zinc showed an advance of 206% in output and 804% in value.

The Electric-Point Mine in Washington

ARTHUR LAKES.

During the past summer, the writer paid a brief visit to the Electric-Point mine in Washington, a young mine that has forged rapidly into notice as a promising lead producer. The region in which the property lies is characterized by uptilted and more or less altered sedimentary rocks of Paleozoic age, such as limestones, quartzites, slates or schists, with few evidences of eruptive rocks or outcrops of granite or other igneous rocks, although the region lies on a great batholith of igneous and once molten granite. The region is hilly rather than mountainous, although ranges of mountains form prominent elements of the distant scenery. Streams flow through valleys and canyons, with here and there small lakes in deep basins. The region is heavily wooded, making prospecting somewhat diffi-

the smallest of the three upon the surface, has since developed into a very important body, being much larger at the 200-ft. level where it is partially defined. The north chimney, which appears larger on the surface than the original discovery, had not at the time of my visit yet been entered by the 200-ft. level. A so-called talc seam of iron-oxide gangue matter followed for over 100 ft. led the workings to a point east of the chimney, from which a crosscut was being run toward the ore body. Shipments have been from 75 to 100 tons daily, consisting of some 25% galena and 75% carbonate of lead.

The most striking features, such as would have attracted the early prospector, are the bright red colors of the surface of the mineralized zone extending north-

THE ELECTRIC-POINT MINE.

cult. Small farms occupy meadows and cleared land along the streams and valleys.

The Electric-Point mine is located on the top of a mountain, which is part of the chain dividing the Columbia and Pend O' Reille valleys at an altitude of between 4000 and 5000 ft. above the Columbia river.

The main surface showings consist of three chimneys of ore, that first discovered being in the center. The discovery has been opened by a "glory hole" or open quarry as shown in sketch, exposing a body of ore somewhat circular in form, about 25 ft. in diameter. On this ore body a shaft has been sunk 210 ft. with drifts and crosscuts on the 100 and 200-ft. levels, proving the shoot or chimney to maintain its size and grade at least to that depth. On the lower level drifts were being run to tap the two other chimneys outcropping at the surface, No. 2 shoot being 40 ft. to the south and No. 3 180 ft. to the north on the strike of the ore-bearing zone. The south chimney,

east and southwest between the uptilted ridges and outcrops of limestone. It would have suggested to them the probabilities of heavy mineralization below the surface, confirmed perhaps, by picking up here and there small nodules of galena, or by digging down a little below the red "gossan" uncovering a boulder of lead weighing many pounds, such as were discovered in excavating a road through the village to the mine as shown in sketch, in which the nearness of these lead boulders to the surface is represented by one of them lying beneath the roots of a fir tree. On analyzing the surrounding red material you find that a large proportion of it consists of lead carbonate stained with iron oxide. The boulders of galena show on their exterior the transition of lead-sulphide or steel-gray-galena to a dull, greenish gray substance, which is lead-sulphate or anglesite, and that to white or iron-stained crystals resembling some forms of gypsum, which are lead-carbonates. From their loose position in the oxi-

dized mass and the chemical transitional signs observed on their surface they evidently represent parts or relics of once large, continuous bodies of galena or unaltered lead-sulphide, to be doubtless hereafter encountered in depth and in place, which partially resisted the oxidizing agencies which reduced the ore near the surface to carbonates and oxides. To what depth these oxidizing effects may extend is unknown,

THE GLORY HOLE.

but the limit is not reached as yet by the lowest or 300-ft. level.

Looking down from above into the glory hole we notice its sides to consist of two varieties of limestone of different colors. One of light yellowish drab color is a true dolomite or magnesian limestone; the other at contact with it of a dark gray, banded with numerous white crystalline veinlets of dolomite, is probably a dolomized limestone. A so-called talc seam of

BOULDERS OF GALENA.

gangue and iron-oxide locally separates the two varieties. Both limestones are involved in the zone of mineralization and mineral replacement. Two small dikes of dark eruptive or igneous rock have been encountered in the workings crossing the limestones, but not at direct contact with or relation to the ore bodies. The latter appear to be a replacement by mineral of dolomitic limestone along a zone of least resistance, accentuated locally by the crossing of bedding planes

or weak places by joint-planes favoring the forming of chimneys or ore shoots at such points. Ascending heated waters charged with mineral solutions acting on the limestone more or less decomposed it and replaced its substance with sulphide ore or galena, subsequently reduced almost wholly to carbonates and oxides by oxidizing waters.

As to the ultimate source or genesis of the ores, we may look to the batholith of once molten granite and other igneous rocks underlying this region, though rarely giving evidence of their existence by outcropping masses or dikes on the surface. That igneous forces were not wanting in the vicinity is shown by the discovery of the small igneous dikes in the workings. We noticed also on our way to the mine large masses of igneous rock thrown out of the way in making the road.

Apart from these few occurrences the batholith of granite may be considered as fully competent to have supplied the heated mineral solutions, and by upheaval to have opened fissures and crevices in the overlying sedimentary rocks such as the local soluble limestones, which by their composition and structure are particularly favorable to mineral replacement.

Belgian Kiddies, Ltd.

At a recent meeting of the New York section of the American Institute of Mining Engineers, Belgian conditions were discussed and the part taken in the relief work for that stricken country by American engineers, and particularly the work of Herbert C. Hoover.

As a result of this meeting there was formed the Belgian Kiddies, Ltd., the objects of which are summarized as follows:

- I. The object of this stock issue is to provide one meal per day for ten thousand Belgian children for the year 1917. Each share sold means 365 square meals for one child.
- II. Our business is constantly growing and no estimate can be made of the requirements for 1918.
- III. Security of the principal is absolutely assured by the personal management of H. C. Hoover and associates.
- IV. That no cash dividends will ever be paid is absolutely guaranteed.
- V. The stock is probably only part paid and is fully assessable.
- VI. The stock is preferred as to holders, the subscribers being preferably taken from the members of the mining and metallurgical professions, and their wives and sisters.
- VII. The demand value of the shares shall be \$12, preferably payable in advance, but installments will be welcome if more convenient to the subscriber.

A letter is being sent out by an informal committee of mining engineers pleading for the support of this worthy cause. The letter reads as follows:

An informal committee of mining engineers, from all over the United States, have decided to give our friend Herbert C. Hoover a Christmas present by taking off his shoulders part of the burden which he and his associates have been carrying for the last 2½ years.

During this time the United States has received a great deal of gratitude from the Belgian people which it has not deserved. To the Commission for Relief in Belgium all praise is due for their work. The C. R. B.—as it is known—has distributed in Belgium goods costing about \$227,000,000, of which the United States has contributed \$10,000,000, or about 4.3% of the total; and much of this has come from a few large foundations. The commission has purchased in the United States goods to the amount of \$125,000,000. We have not even paid a fair commission thereon. Reduced to

a per capita basis, we have given 8 cts. apiece. Canada has given 18 cts. per capita, New Zealand \$2.34 and little Tasmania \$6.25 a head. Yet the United States gets most of the credit. We have been obtaining gratitude under false pretenses.

This is naturally discouraging to us who know and appreciate the work of American engineers in Belgium. These men have been keeping alive a population of 9,000,000 on one meal a day. This is not enough for children. (Would you like it for yours?) At present 1,000,000 children are failing in health, and the C. R. B. has asked us Americans to assume the proper feeding of these children as our little share of the big job.

To do this right, the C. R. B. has started to give the children a nourishing noon-day meal, and they have not the money to carry it on. This costs only \$1 per month per child (3 cts. a day). This seems incredible, but as the overhead expenses of the C. R. B. are only $\frac{3}{4}$ of 1% of the gross cost you will understand that this is real engineering efficiency.

As engineers we want to show our appreciation and so we have organized an informal syndicate to float a new venture. We would like to cable Hoover before Christmas that we will take a block of "Belgian Kiddies" off his hands.

Don't you want to come in with us on this?

The Freezing Point of Mercury.

The Bureau of Standards has just completed a very careful determination of the freezing point of mercury using platinum resistance thermometers to measure the temperature. The result of this work gives -38.87°C . (-37.97°F .) for this temperature. It is interesting to note that as far back as 1862 the English government, recognizing the importance of an accurate knowledge of this point, appropriated £150 to have it determined. The value then obtained, -38.85°C . (-37.93°F .) is in good agreement with that obtained at the bureau. However, other determinations made previous to and after this early work cast some doubt as to its accuracy. It can be seen that a knowledge of the freezing point of mercury is of great importance to thermometer makers as it marks the lower limit to which a mercurial thermometer may be used and furnishes a method for calibrating or pointing the scale below 0°C . (32°F .)

Often trimming ore cars underground before they leave the chutes or working faces will save considerable loss of ore in transit to the shaft. It will also save part of the wages expended in cleaning tracks, ditches, etc.

Dewatering and Screening Apparatus.

Where ore is sorted into different sizes entirely by water classifying, it has been found impossible to re-crush the oversize effectively, owing to the presence of the large amount of water which has to be drawn from the classifier along with the over-size material. In order to remove this excess of water a shaking screen has been invented which makes it possible to remove all of this excess of water at a minimum cost. James B. Ballantine, who has designed this apparatus, says that he has been able to pass 50 tons of broken ore per hour over a screen of this type 2 ft. square, and obtained an ideal product for recrushing.

In the operation of the classifier, the rotation of

DEWATERING AND SCREENING APPARATUS.

the paddle wheel produces a circulation of the water in the tank, which begins to travel toward the left on one side of the partition, passing around the end and through the baffles.

The action of this current of water upon the crushed or pulverized material performs the classifying function, and the material settles in the tank according to its size, the largest particles being the heaviest. Consequently the coarsest portion of the product is first deposited and falls into the hopper (15) and passes to the dewatering apparatus (17). The next coarser product settles in the hopper (18) and passes to the dewatering and screening member (21). The other grades which do not require to be crushed, pass through the openings 22, 23, 24, 25, etc. The product from the dewatering apparatus (17) and the coarse products which do not pass through the screen (21) are returned by an elevator to the crusher (48).

Metallurgical Treatment of Molybdenum Ores

HERMAN FLECK.*

Nearly everything has been tried of an ore-dressing nature on the molybdenum ores—no two of which are alike—and, on the whole, with surprisingly interesting results. Molybdenite is different from most minerals. It is heavy like a metallic sulphide and behaves in part like these, and then it is flexible, and not brittle, with strong basal cleavage and a tendency to flake like graphite or mica. Ordinary methods of concentration are hardly applicable.

However, combinations of heat, newer principles, such as flotation, magnetic and electrostatic separation, have done much to win good concentrates from ores which were looked upon quite unfavorably a few years ago. Only rarely does the mineral occur so coarsely divided that it may be hand-picked.

Molybdenum is brought on the market in two forms, powder and ferroalloy.

The first of these is invariably made by heating some form of oxide with a reducing agent. Carbon in form of charcoal is usually employed. The first stage of reduction is the dioxide which forms readily, and, unlike the trioxide, is not readily volatile. Prolonged heat and high temperature effect further reduction of this to metal.

The second form, ferromolybdenum, with varying molybdenum contents, is made by the use of the electric resistance furnace, either direct from the sulphide or from the roasted high-grade sulphide. The advantage here is that impurities may be slagged off, whereas in case of powdered metal, unless the impurities are subject to extraction with a solvent, they remain with the metal.

Before the increased present demand manufacturers were exacting. Standard requirements for concentrates were 85 to 90% MoS_2 and, except in very small amounts, copper, bismuth, arsenic and tungsten, when present, were penalized. Because of increased demand the requirements are made more easy to meet.

The reasons are obvious. The purer the molybdenite, the less treatment required for the final operation of reduction. When the demand is greater than production, as at present, the increase in price takes good care of additional preliminary refining treatment of lower grade material. The preparation of the oxide in commercially pure form is not an easy matter.

This may be done by roasting the sulphide first to oxide and then leaching the mass with ammonium hydroxide, which dissolves the oxide to form ammonium molybdate. Copper oxide forms an objec-

tionable constituent because it also dissolves and reappears in the subsequent evaporation of the ammoniacal solution. Evaporated to crystallization, preferably under reduced pressure, so-called ammonium molybdate crystallizes out from the filtered solution. This contains 81.55% of molybdic oxide, 8.27% ammonia and 10.19% of water. On ignition ammonia is driven off and molybdic oxide results. A previously mentioned process whereby the oxide is won by volatilization directly from the ore may be referred to here.

When the oxide is heated in a wind furnace with carbon in graphite crucibles a dark powder results which is commercial molybdenum. An analysis of such a product showed 95% of molybdenum and 2 to 3% carbon combined by cementation. The metal forms carbide readily. With care a product may be made 99% pure.

Among the early manufacturers Sternberg and Deutch in 1892 made a metal which contained 3% carbon by igniting precipitated calcium molybdate, in similar fashion, with carbon. Their factory was situated near Berlin and the capacity was 200 kg. metal a day. The admixed calcium oxide was leached out of the metal with hydrochloric acid. The metal at that time brought 86½ cts. a pound. It contained 3% carbon.

Moissan first introduced the use of the electric furnace. By heating ammonium molybdate he made the dioxide, which he treated with 10% pure carbon. The resulting metal contained carbide.

Guichard produced a metal of high carbon contents directly from the sulphide in the electric furnace. The ore, nearly pure molybdenite, gave a metal of 91.5% molybdenum contents. Current used, 300 amp., 50 volts.

Robert Keeney of the Colorado School of Mines found that either the raw or roasted ore can be used in making ferromolybdenum in the electric furnace. Lime is used as a fluxing and desulphurizing agent. Ferric oxide is subsequently added for decarbonizing purposes. In the case of direct use of molybdenite the sulphur slags off in form of calcium sulphide, with a current of 900 amp., 50 volts, sulphur is found to be entirely expelled from molybdenite. However, about 7% of carbon is absorbed, partly graphite. This can be reduced by the decarbonizing action of freshly added oxide. Wulfenite when fluxed with sodium carbonate gives oxide of lead and sodium molybdate. The latter is soluble in water the former is not. From the solution the oxide can be gotten and worked into metal. Such mention seems necessary now, since wulfenite in 1914 found a good mar-

*Excerpts from article in Colorado School of Mines Quarterly.

ket at 60 cts. per pound of MoO_3 contained in good grade concentrate.

The thermit or alumino-thermic process, which depends upon the greater heat of formation of aluminum oxide for reduction, produces a high-grade metal free from carbon. Ninety-eight to 99% of molybdenum and the remainder iron is the composition of the product.

Producers of Crude Barytes.

In the last 2 years the Geological Survey has had so many inquiries from both producers and consumers of barytes concerning possible markets and sources of supply that it became advisable to indicate in a general way the present conditions of handling barytes.

In Missouri most of the barytes passes through two and sometimes three hands before it reaches the consumer. The miner sells to a local buyer, most often a storekeeper, in exchange for goods. This buyer sells to a large buyer having access to the railroad, who in turn sells to one of the larger selling companies or to the consumer. It is next to impossible to deal with the miners or even the first buyers. Often the second buyers are agents for some of the larger purchasing companies and do not deal directly with the consumer. In the eastern field conditions are not quite the same. Much of the mining is done by the owners or lessees of the property and the product is sold to large buyers or direct to the consumer. In fact, many deposits in the eastern states are worked by the consumers themselves, though some of these operators have barytes to sell.

In the following list will be found the names and addresses of the principal people able to supply crude barytes. The addresses given are those of the office of the companies, which are not in all cases at the mines:

J. N. Adams, Del Rio, Tenn.
 Anson G. Betts & Co., Box 792, Asheville, N. C.
 Big Tom Barytes Co., Cartersville, Ga.
 Cahaba Mineral Co., Leeds, Ala.
 H. C. Carter & Co., Halifax, Mo.
 Carolina Barytes Co., Stackhouse, N. C.
 A. H. Carr, Potosi, Mo.
 Casey & McGregor, Potosi, Mo.
 Cherokee Chemical Co., 109 Hollingsworth street, Baltimore, Md.
 L. E. Cole & Co., Blackwell, Mo.
 J. F. Doherty, Sweetwater, Tenn.
 Durex Chemical Co., 320 Fifth avenue, New York, N. Y.
 J. C. Finck Mineral & Milling Co., 101 Barton street, St. Louis, Mo.
 B. W. Gahagan, Stackhouse, N. C.
 Georgia Peruvian Ocher Co., Cartersville, Ga.
 Johnson Bros., Fletcher, Mo.
 Krebs Pigment & Chemical Co., Newport, Del.
 R. H. Langhorne, Evington, Va.
 Chas. L. Lawton, Bessemer City, N. C.
 A. Long & Son, Cadet, Mo.
 James Long, Potosi, Mo.
 McCready & Cole, Blackwell, Mo.
 H. J. Moore, Sweetwater, Tenn.
 New Riverside Ocher Co., Cartersville, Ga.
 Nulsen, Klein & Krause Manufacturing Co., Levee and Sidney streets, St. Louis, Mo.
 Paga Mining Co., Cartersville, Ga.

Pittsburgh-Potosi Lead Co., 5527 Ellsworth avenue, Pittsburgh, Pa.
 Point Milling & Manufacturing Co., Mineral Point, Mo.
 Potosi Lead, Barytes & Mercantile Co., 721 Locust street, St. Louis, Mo.
 W. T. Reavis & Sons, Henley, Mo.
 South East Missouri Lead Co., Potosi, Mo.
 Southern Leasing Co., Cartersville, Ga.
 A. & C. Stackhouse, Stackhouse, N. C.
 C. A. Stocking & Son, De Soto, Mo.
 C. A. Sulzer, Sulzer, Alaska.
 A. L. Taylor, Canon City, Colo.
 Thompson-Weinman & Co., 100 William street, New York, N. Y.
 U. S. Barytes Co., Tiff, Mo.
 Washington Land & Mining Co., 307 Washington street, St. Louis, Mo.
 White & Bro., Cadet, Mo.

Columbia Section, American Institute of Mining Engineers.

L. K. ARMSTRONG.*

The sixth annual meeting of the Columbia Section, A. I. M. E., was held in Spokane hotel, Spokane, Nov. 25.

With Stanly A. Easton, manager of the Bunker Hill & Sullivan Mining & Concentrating Co., in the chair about 25 members and guests sat down to a six-course dinner, after which Mr. Easton addressed the meeting as retiring chairman citing the activities of the Columbia Section during the year past, called attention of the members to the present close relation of the local sections and the parent organization, gave some detailed information on the Arizona meeting which was held in September last, dwelt at some length on the value of professional ethics without which no engineer can attain high standing among his peers and with the public, warned his hearers that the present period of inflated prices will prove the "acid test" in mining, stated that in his opinion the present European war will be determined largely by the availability of the metals, and finally referred to an article in a recent issue of Atlantic Monthly by Dr. Eliot, formerly president of Harvard University, in which he referred to "miners and other adventurers," as being based upon ignorance of the men engaged in the industry and to be deplored because of the high standing of the author.

The secretary-treasurer followed with his report which showed the membership to have increased during the year from 129 to 158. He also read several letters from members who were not able to attend and one from E. Jacobs, secretary Western Branch, C. M. I., who found it impossible to attend although it was an unusual circumstance.

Election of officers then followed resulting as follows: Chairman, W. H. Linney, mining engineer, Spokane; vice-chairman, Oscar Lachmund, general manager B. C. Copper Co., Greenwood, B. C.; secretary-treasurer, L. K. Armstrong, mining engineer, Spokane. These with Stanly A. Easton, past chairman, and S. Shedd, Professor of Geology, Washing-

*Secretary-Treasurer Columbia Section, A. I. M. E.

ton State College, Pullman, Wash., are the executive committee.

W. H. Linney emphasized the good work which the Columbia section has done and stated that by the aid of the other officials and the members he hoped the section would keep its high standing and gain something in membership and value to the community.

Prof. C. G. Warfel, Assistant Professor of Mining at the State College, Pullman, Wash., read an interesting paper on the "Electric Reduction of the Iron Ores of Eastern Washington," the material of the paper having been gathered by request of the Spokane Chamber of Commerce and being preliminary throughout, and the figures submitted being tentative, yet approximately correct. Assuming a cost of materials delivered in Spokane about as follows:

Iron ore	\$2.50 per ton
Coke	\$5 to 7.00 per ton
Limestone	2.00 per ton
Labor	2.00 per diem

It would be necessary to procure electric current at a cost of about \$2 per horsepower year (\$16 per kilowatt year) to meet competition.

The paper covered iron analyses, construction costs, markets, depreciation and amortization, and other details.

R. S. Ord, manager of the Corbin Coal & Coke Co. believed the use of the lower grades of coke would not be possible as manufacturers were not partial to the low-grade or "black butts" coke on account of the narrow margin of profit and the better demand for high-grade coke at reasonable margins of profit. He also believed electric current costs could be cut below present rated market prices.

W. Earl Greenough, former manager of the Marsh mines in the Coeur d'Alene district, stated that competitive rates indicate a reduction on rates quoted, i. e., \$25 to \$30 per horsepower year.

Prof. F. A. Thomson, Professor of the Mining Department, Washington State College, Pullman, believed the question would be solved by adequacy of ore supply and power costs.

S. L. Boyer made reference to power costs at points of generation and at points more or less remote therefrom.

Prof. D. C. Livingston, Professor of Geology, University of Idaho, cited power costs in the irrigated areas of Southern Idaho where power is sold during non-use periods at a very low price, approximating \$16 per horsepower year, or thereabouts.

Flotation was discussed by D. F. Haley, consulting engineer for the Consolidated Interstate-Callahan Mining Co., who gave some interesting figures on differences in grinding at certain milling plants. S. A. Easton cited the present Latouche operation in Alaska where all sliming is securing a satisfactory result and of the character of the Alhambra ore in the Coeur d'Alene which is very finely disseminated throughout the gangue, the silver-lead contents of which will probably be recovered by an all-sliming process yet to

be worked out, in which flotation will play an important part. Richard Marsh discussed the question in reference to selective and preferential terms and Prof. Thomson reported an interesting laboratory test on an ore carrying the copper, lead and zinc sulphides in the separation of which he was successful by the aid of flotation and which he believed could be made of commercial value.

Co-operation in geological survey work, between the state and national surveys was discussed by some of the members who were willing to leave the question open for discussion at a later date.

More frequent meetings of local members are to be tried out through an early call upon all local members.

The following named members were selected as a committee on papers: J. C. Haas, S. A. Easton, L. K. Armstrong.

Method for Concrete Piling.

Sheet piling, walls, curbing, casings, caissons and similar structures of concrete can be erected without the use of molds by employing the sectional piling illustrated in the drawings. The sections are designed to be set or driven edge to edge, as in the case of the ordinary interlocking sheet piling. There are grooves in both edges of each section, the part which corresponds to the tongue being concrete, which is poured

METHOD FOR CONCRETE PILING.

into the holes formed by the abutting grooves after the sections are set. Each section is reinforced by four vertical rods, as shown in the cross-section, and these are tied together at intervals by looped wires, and also to two other rods which stand vertically, one in each groove. When the concrete is poured it not only binds the sections together mechanically, but at the same time effectually seals the joints. Lyman B. Langworthy of Chicago, Ill., is the inventor.

What the Mining Companies are Doing

The Porphyries' October Production.

The four leading porphyry copper producers showed substantial gains in production during October last as compared with October, 1915. Utah Copper showed a slight falling off as compared with September production, as did also Chino. Both Nevada Con. and Ray Con. outproduced more copper in October than they did in September.

The following table (in pounds) gives the production by months in 1916 as compared with the same months in 1915, 1914 and 1913:

UTAH COPPER.				
	1916.	1915.	1914.	1913.
January	11,999,916	8,009,646	10,649,036	7,560,521
February	11,819,972	8,202,467	9,492,898	7,819,900
March	12,711,651	10,203,882	12,704,220	8,504,040

Utah Copper Co.

Without the aid of its 50% interest in Nevada Con. Utah Copper Co. is now in the Anaconda class with earnings of \$1,000,000 a week. In fact, on a basis of 240,000,000 lbs. annual production, a 6½-ct. cost and 30-ct. price, Utah stands to earn \$6,400,000, equal to \$34 a share.

By the inclusion of one-half Nevada Con. earnings on current rate of production and costs, the Utah profits jump to \$76,000,000, or to \$46 per share. This brings Utah's earnings up to \$1,500,000 a week.

It costs Anaconda at least 4½ cts. and possibly 5 cts. more per pound to produce its copper than the average at Utah. To offset the higher cost to some extent, however, Anaconda has a larger production, now at the rate of 360,000,000 lbs. a year, against Utah's output of 240,000,000 lbs. It also has a large miscellaneous revenue from smelting, refining and from its new zinc business.

Assuming an 11-ct. cost at Anaconda, a 30-ct. copper price and 360,000,000-lb. production, this company's earnings

must now be at the rate of \$1,300,000 weekly. Including miscellaneous revenues the figures probably exceed \$1,600,000.

No other copper mining companies in the world from direct operations of their own properties can lay claim to earnings of \$1,000,000 a week.

Davis-Daly Copper Co.

The report of the company for the quarter ended Sept. 30, shows as follows:

Receipts—	
Ore returns	\$105,059
Miscellaneous revenues	2,550
Total	\$107,610
Disbursements—	
Development	\$ 40,268
Mining cost	64,228
Equipment	1,566
Butte general expense	3,989
Boston expense	2,148
Total	\$112,199

In his report Secretary Schirmer says:

During the period development work totaled 961 ft., comprising 324 ft. of drifts and 637 ft. of crosscuts.

The mining claims of the company, located as they are, along the border of the copper zone, are between the copper and zinc areas and covering portions of both, have long been known to contain zinc ore bodies of substantial size. Until recently, the development of zinc veins in Butte has been avoided, with the exception of the Butte & Superior and the W. A. Clark properties, which are exclusively zinc. In addition to the development of copper ore bodies the Davis-Daly Copper Co. has now turned its attention to the development of zinc and an arrangement for the milling of zinc ore has been made with the Butte-Detroit Copper & Zinc Co., the owner of a modern zinc mill located in Butte. Your mine is ready to deliver a limited tonnage of zinc ore and the mill is ready to receive it, and from now on zinc ore as well as copper ore will be developed and mined.

The new hoisting engine is ready for shipment. It is expected that the new hoist will be in operation about the first of the year, and when this is completed, mining costs should become normal.

Because of this adequate hoisting machinery reducing operating costs and greater tonnage available, a more staple and steadily increasing net earning should occur.

Shipments for the 3 months amounted to 198 cars, aggregating 10,808 tons, producing 679,008 lbs. of copper and 57,069 ozs. of silver.

International Nickel Exonerated.

A statement has recently been made by Arthur Meighan, Canadian solicitor general, absolving the International Nickel Co. from all charges of selling nickel to Germany. This statement is backed by the Canadian government and the British admiralty, which says:

"To allied and neutral countries not one pound and not one shipment of nickel has gone from International Nickel Co. except with approval of British government through the committee on enemy supplies."

The Canadian government has placed an embargo on exportation of nickel matte from Canada, and regarding exports to United States the solicitor general says in his report:

"We keep the closest eye on all that goes across the border. We know the purpose for which it goes and unless we approve, none goes."

Mason Valley Mines Co.

A new lease of life has been taken on by the Mason Valley Mines Co. with its purchase of the Grey Eagle mine in northern California. The property was purchased for 144,250 shares of stock of the former company. Of the total capital stock of \$2,500,000 divided into 500,000 shares,

par value \$5 each, there are now issued and outstanding 155,750 shares; the 144,250 shares authorized for the Grey Eagle purchase and 200,000 shares which have been sold at \$5 a share for working capital and construction purposes.

The merger of the two properties gives the combined company the Grey Eagle mine, which consists of 14 patented claims covering about 256 acres, and the Nevada properties, including the Thompson smelters, and the Mason Valley mines.

Mason Valley will begin business with \$1,300,000 cash in the treasury.

H. C. Krumb made an examination of the Grey Eagle mine several years ago and estimated 450,000 tons of ore containing 4.64% copper and \$1 gold per ton as well as large quantities of lower grade ore. O. R. Whitaker, of Denver, also made an examination and his report was similar to that of Henry Krumb, although he added 600,000 tons of ore containing a little over 1% copper, a total of 1,100,000 tons containing an average of 2.75% copper and 70 cts. gold per ton. Both Engineers Krumb and Whitaker said that prospects of developing a much larger tonnage were good.

Active development work will be started this winter and at the same time a decision as to the best methods of treating the ore will be reached. Preliminary treatment by the oil flotation process indicates that good results can be obtained.

It is not unlikely that at least during development stages shipments may be made to the Thompson smelter at Mason Valley on completion of the railroad to the Grey Eagle mine which is about 60 miles distant from rail connection.

Arrangements have already been made by the Mason Valley Mines Co. for a coke supply and as soon as the railroads can supply sufficient cars, operations will be resumed at the Thompson smelter. Arrangements have already been made for treatment of large tonnages of Bluestone ore where it is estimated that over 1,000,000 tons have already been developed. Work has already been started at both Mason Valley and Bluestone mines. In addition, the company is also doing development work on other properties under option.

Goldfield Con. Mines Co.

Production and earnings of the Goldfield Con. Co. for October compare with previous months as follows:

	Oct.	Sept.	Aug.	July.	June.	May.
Tons ore mined.	30,000	17,300	26,700	29,000	32,400
Net	\$17,045	\$16,072	\$18,211	\$30,016	\$40,453	\$52,500

Miscellaneous Company Notes.

Tonopah-Belmont net profits for October were \$90,872. The company milled 12,367 tons of ore from which there was recovered 1,974.985 ozs. gold bullion and 185,167.75 ozs. silver.

The Tonopah Extension Mining Co. reports for October as follows: No. dry tons milled, 10,938; ozs. gold bullion recovered, 1,488.12; ozs. silver bullion, 153,317; net profit, \$50,902.

It cost Miami Copper Co. 3.978 cts. a pound to turn out its record yield of 5,054,153 lbs. of copper in October. The September cost was 9.266 cts. The general improvements in cost has been attained in the face of constantly increased wages and higher costs for materials and supplies of all kinds.

Wolverine's October production amounted to 504,499 lbs. of copper. Production in previous months of 1916 follows: January, 460,967; February, 516,607; March, 577,684; April, 588,032; May, 495,743; June, 493,378; July, 545,156; August, 517,851; September, 470,190; October, 504,499.

The Mohawk Mining Co. will earn about \$22 a share in 1916, thanks to a very favorable production cost. It has paid dividends this year amounting to \$1,700,000 and will have a surplus at the end of the year approximating \$500,000. In October, Mohawk produced 828 tons of mineral from the

milling of 61,757 tons of rock. This yielded an average of 19.97 lbs. of copper per ton, or a total of 1,233,463 lbs. of copper.

Shannon Copper Co. has sold copper to the end of June, 1917, at 32 cts. a pound. Only a small portion of its output was disposed of at this price, as the management believes that it is better to sell only a portion of its output so far ahead, with copper prices still maintaining an upward tendency.

After paying a dividend of \$450,000 on Oct. 31, the Arizona Commercial Copper Co. had on hand \$450,000 in cash. At the present time the company is shipping about 150 tons per day and on this is earning \$60,000 a month on 30-ct. copper. According to President Charles S. Smith, the company will soon be in shape to ship 300 tons per day and make anywhere from 750,000 to 1,000,000 lbs. of copper per month.

The report of production and development operations of the McIntyre Co., Ontario, for the quarter ended Sept. 30, 1916, is as follows: McIntyre ore—Tons milled, 28,933; value per ton, \$9.08; gross value, \$262,863.49; recovery, \$250,744.69; operating costs, \$142,900.00; per ton, \$4.93; operating profit, \$107,844.69. Custom ore—Tons milled, 6877; profit from milling custom ore and from subsidiary company operations, \$28,239.09. Total tons milled, 35,810; total operating profits, \$136,983.78.

About \$10,000 is to the credit of the Lucky Jim mine for payment toward the balance of \$12,000 remaining due on the first mortgage, according to the monthly report of the receiver, A. G. Larson, which has been filed at Nelson. The total amount due for ore is \$16,166. Accounts payable amount to \$5432, leaving a credit balance of \$10,733. Against this is a mineral tax of about \$700, leaving a trifle over \$10,000 to the good. Last month's net profit was approximately \$5000.

The output of copper by the Magma Copper Co. by the close of November will have been practically doubled. The company heretofore has been producing at the rate of between 6,000,000 and 8,000,000 lbs. annually. Net profits on that amount of copper have been running at the rate of more than \$5 a share annually. With present facilities capacity can be doubled without any additional expense to speak of. Arrangements have been made to greatly enlarge the output beyond what it will be with present facilities.

The Utah Apex Mining Co. stockholders at annual meeting held last week authorized a reduction of the company's capitalization of 600,000 shares, par value \$5 to 120,000 shares of \$25 par value. Number of directors was reduced from nine to five. The following were elected: John J. Murphy, Dr. Nicholas du Vally, Wm. F. Coffin, R. F. Haffenreffer, Jr., and Charles G. Schirmer. This leaves Frank A. Schirmer (recently resigned), Hiram M. Burton, Clifford M. Brewer, William L. Creden and J. W. Saladine, who were directors last year, out of the present line-up.

There is no doubt that at the end of the year Miami Copper Co. will show earnings for the year of close to \$12 a share. Dividends have been paid during the year totaling but \$5.75 or \$4,295,905. This compares with dividends of \$2.25 per share in 1915, \$1.50 in 1914, \$2 in 1913 and \$1.50 in 1912. With costs at 10 cts. per pound and copper selling at 28 cts. per pound, Miami is capable of earning at the rate of \$14 a share on its 747,114 shares. On a 75,000,000 (now 60,000,000 lbs.) production, and the same selling price and same costs the company could earn close to \$18 per share.

It is understood that the North Butte Mining Co. will ship its zinc ores to the Anaconda plant to the extent of 300 tons daily. The company is reported to have at least 2 years' supply of zinc ore in sight in the present workings that are opened up for the extraction of copper. Throughout its productive career North Butte, as in various mines of the Anaconda Co., ran through ground highly shot with zinc values. Whenever found they were left in the stopes as prior to the new era for zinc, commencing with the European war, it was not profitable to try for commercial production.

“A Trespass Both Stupid and Indecent.”

Our temperamental and somewhat quixotic co-worker on the Pacific Coast has charged another windmill. It is not the King's English that he is defending this time, nor an obvious question of common honesty that he is elucidating under the euphonious title of “Professor of Ethics.” This time it is the stupendous question of the right of pre-emption by first usage of any general descriptive term as a title to a book. Because he saw fit to call a compilation of articles upon flotation “The Flotation Process,” he claims that it was a “trespass both stupid and indecent” for Mr. Stander and Mr. Megraw to call their books upon the flotation process by the same title. This is as though the shade of Macaulay should arise and peevishly complain because others after him had written upon the history of England and entitled their books “A History of England.” We wonder how many books upon algebra have been called simply “Algebra”; how many books on the cyanide process have been called the “Cyanide Process”; how many books upon descriptive geometry have been called simply “Descriptive Geometry”; how many books upon qualitative analysis have been called simply “Qualitative Analysis,” or upon psychology simply “Psychology.”

If one desires individuality of title for a book he must display individuality in the selection of its title, just as any family by the name of Smith must display individuality in the selection of the children's names if they want to differentiate them by their first names from other Smiths.

The stupidity in this whole affair is for anyone to think that a title gives individuality to a book. It is the author that does that if there be any to the book. Hundreds of books may be written upon the history of England and called such, and yet Macaulay's “History of England” will ever stand out from them. Why? Because of what he put into his history, not because of its title.

Butte & Superior Co. Wins Right to Continue Dividend Payments.

From our Butte correspondent we learn that in the decision handed down by Judge George M. Bourquin of the Federal District Court the petition of the Minerals Separation, which asked for an injunction to restrain the Butte & Superior Co. from declaring dividends and distributing its profits to stockholders in this manner, has been denied. The court also discharged the Butte & Superior Co. from the order issued Nov. 13, 1913, requiring it to post a bond in the sum of \$75,000 to secure a possible judgment for infringement of patent on the oil flotation process, and requiring monthly reports of the results of the process at its mill.

The decision is a sweeping victory for the Butte

& Superior Co., so far as the phase of its controversy with the Minerals Separation Co. is concerned. The question of the infringement of patent involved is now before the United States Supreme Court and a decision is expected within a few days.

The decision of Judge Bourquin means that the Butte & Superior Co. may go ahead immediately with its plan for the enlargement of its mill and increasing its capacity. Within a few minutes after the decision was rendered Manager J. L. Bruce had a force of men at work and the improvement will be rushed to completion.

The decision of Judge Bourquin ends the possibility of interference of the usual quarterly dividend of \$1.25 per share in addition to the extra dividends which have been declared each quarter now for over 2 years.

The Butte & Superior's new shaft will soon be equipped and ready for operating and this, with the increased mill capacity, will add greatly to the capacity and output of the entire plant. The figures for the November production of Butte & Superior are not yet available, but an estimate on production to date indicates that November will be one of the best months of the year 1916.

Attorneys for the Minerals Separation Co. have filed the necessary notices of appeal, but it is probable that the decision of the United States Supreme Court that is expected shortly will dispose of all the points involved in this and other similar suits against other companies over this same patent question.

Over-estimating the Value of Mine Machinery.

We have a communication from one of our readers in Arizona, which is interesting for what it suggests. He says:

I have for the past 3 years been devoting my time to improvements in rock drills. My attention has been devoted mostly to improvements of the wet-drilling system. On one of my improvements a patent has already been issued, and on two others the patents are still pending. I have applied these improvements to one of the standard machines now on the market, and can safely say that it increased the efficiency of this machine 50%. My idea of the proposition is to make, or have made, my own machine complete, with the improvements built in. This would make a machine that would be by far superior to anything on the market today. This I will be glad to demonstrate as soon as the patents pending are issued.

What companies would you recommend to take this proposition up with, and what departments?

Our correspondent's judgment of the worth of his invention may be justified. We hope it is; and we shall be glad to put him in touch with any of our clientele who may have a practical interest in the matter.

Enthusiasm on the subject of rock-drill improvements is, however, perennial; and many have been the disappointments therefrom. What, for example, became of the famous D 21 stoppers (or was it D A 21's?),

which were so widely heralded in the Cripple Creek district a number of years ago? Probably the scrap heap can best answer. Such fiascos, which are not uncommon, lead mine operators to be rather cautious about taking up "improved devices"; and it is only after numerous local tests, successfully conducted, that a new drill, backed by first-class manufacturing and sales effort, gets a real foothold in the mining or contracting industries.

The whole subject of water purification is one of great importance in connection with any mine property, not only for boiler feed purposes, but for general supply where any considerable community exists in the vicinity of the mines. It would take too much space to go minutely into the chemical theory of the subject, or taking up the mechanical details and specifications of a water purifying system, but it is hoped that readers who have serious water problems to face will read the article in this issue by Mr. Newman. Not only will it suggest and lead to steps for immediate betterment, but communications will bring up individual problems for publication, with the answer, in the future issues.

Aside from its monopolistic effect, the new conservation rulings of the government covering coal mining in the west is having the effect of putting a damper on opening up new coal fields. Practically all the operating coal mines purchased their property under the old laws at \$10 or \$20 per acre. Under the new rulings these lands are worth all the way from \$100 to \$400 per acre. The average at which coal lands may now be leased is 10 cts. per ton, irrespective of the quality or grade of the coal. Under the increased valuation of the government a new coal company stands but little chance with the old companies when it comes to competition. The new rulings have reversed the theories of the conservationists—the small operator hasn't a ghost of a chance.

In times of copper prosperity there has always been rumors of mergers and the year 1916 has been no exception. This time it is a big consolidation with the Kennecott corporation as the "big squeeze." The plans, according to the rumors in circulation, are that the Kennecott (now owning 25% of Utah Copper) is to acquire 75% of the Utah Copper Co.'s stock, not now owned by the former, and then through the Braden Co., which Kennecott owns, absorb the Chile Copper Co. Then there is the Cerro de Pasco Copper Co. and the Andes Copper Co. of South America, owned by Anaconda, that might be brought into the fold.

Many a good mining property has been abandoned for lack of funds occasioned by the individual stockholders declining to recognize their responsibility or co-operate with the management.

Copper exports from Atlantic ports for the week ending Nov. 30 were 6,448 tons: Since Nov. 1 they were 21,433 tons; same time last year 19,396.

PERSONAL.

R. W. Schultz, representative of the Minerals Separation Co., Ltd., is at Houghton, Mich.

E. C. Brain, general manager of the United Gold mines, Sumpter, Ore., is in Spokane, Wash.

George Ross, Wallace, Idaho, is back from a trip to Portland, Ore., and other coast cities.

D. C. Jackling will return to Salt Lake City about Dec. 15 after an extended trip to New York.

Alexander P. Rogers, mining engineer, New York, has returned from a trip to Dutch Guiana.

Charles A. Peet, consulting engineer, Salt Lake City, Utah, has returned from a trip to Ely, Nev.

Howard D. Smith, mining engineer, San Francisco, has recently returned from a trip to New York.

E. H. Hamilton is now consulting metallurgist for the Consolidated Mining & Smelting Co., Trail, B. C.

E. G. Spilsbury, consulting mining and metallurgical engineer, New York, is on professional work in Cuba.

Richard A. Parker, consulting mining engineer, Denver, Colo., has returned from a trip to various parts of Oregon.

F. B. Caldwell, superintendent of the Mexican Candelaria Co., San Dimas, Mexico, is now located in Woodland, Calif.

C. H. Hayes, in charge of development at the Stonewall Jackson mine, Globe, Ariz., has made a trip to El Paso, Texas.

Arthur Allen, formerly with the Calumet & Hecla Co., Calumet, Mich., is now with the Highland Mining Co., Ashcroft, B. C.

Mark R. Sherman, Chicago, and associates have been in Lordsburg, N. M., inspecting the property of the National Gold & Silver Mining Co.

C. L. Herrick, former mill superintendent of the Gold Hunter mill, has recently been appointed general manager for the company at Mullan, Idaho.

Edwin Higgins, formerly with the California Industrial Accident Commission, has opened offices as a safety and efficiency engineer in San Francisco.

G. P. Holmes, recently with the St. John's Mining Co. at Montezuma, Colo., has joined the engineering staff of the Aetna Chemical Co., at Drummondville, Quebec.

John Jacke, mining engineer, who has been in the operating department of the Calumet & Hecla Co., has been appointed mining captain of White Pine Extension.

F. K. Brunton is now at Humboldt, Ariz., with the Consolidated Arizona Smelting Co. He was formerly with the American Smelting & Refining Co., Garfield, Utah.

George C. Moore, chemist, and H. E. Bierce, mining engineer, both of Los Angeles, Calif., have been examining properties around Phoenix, Ariz., and are now in Globe, Ariz., on a similar mission.

C. T. Griswold of the Associated Geological Engineers has transferred his activities from Wyoming to Oklahoma. M. L. Fuller, managing engineer of the Engineering Division of the same organization, visited the New York office recently.

F. K. McIntosh, former superintendent, Gold Road Mines Co., Gold Road, Ariz., has been in Higuera, Mexico, with the Compania Minera Paloma y Cabrillas and will go from there to Laredo, Texas, for the Compania Minerales y Metales.

In recognition of his inventing the Dorr thickener and other metallurgical apparatus, J. V. Dorr has been awarded a John Scott Legacy Medal by the city of Philadelphia on the recommendation of the Franklin Institute.

F. N. Flynn, smelter superintendent of the Arizona Copper Co., has resigned to become affiliated with the Chile Exploration Co., Chuquicamata, Chile. The vacancy will be filled by former Assistant Superintendent R. H. Hatchett.

OBITUARY.

Frederic Stanwood, for many years treasurer of the Copper Range Co., died at Brookline, Mass., aged 65 years, after a brief illness.

Frederick J. H. Merrill, one of the best-known consulting geologists and mining engineers in the west, died at his home in Los Angeles on Dec. 1 from an apoplectic stroke. He was born in New York in 1861 and was graduated from Columbia School of Mines in 1885. Among the various appointments held by him was that of assistant on geological survey of New Jersey, 1885-1889; assistant state geologist of New York, 1890-1903, assistant director New York State Museum, 1894-1904, and state geologist of New York, 1899-1904. He carried on private practice since 1904, and served as director of various American exhibits. He was a frequent contributor to mining literature and scientific publications.

SCHOOLS AND SOCIETIES.

Southwestern Engineering Society.—An endeavor is being made by A. F. Barnes, Dean of Engineering at the New Mexico College of Agriculture and Mechanical Arts, to organize an engineering society to include the states of New Mexico, Arizona and Texas. He has the support of many noted men in the district already. Until the time for the assembling of the society can be decided on communication should be addressed to Prof. Barnes.

Missouri School of Mines.—An organization to be known as the Metallurgical Society of the Missouri School of Mines has been perfected. The attention of the society is to be devoted to matters pertaining to metallurgy, ore dressing and chemistry. Officers were elected as follows: T. P. F. Walsh, president; H. A. Horner, vice-president; C. L. Epperson, secretary-treasurer. An executive committee was appointed to draft a constitution. Meetings are to be held twice a month.

American Institute of Mining Engineers.—The annual election of officers of the Columbia section occurred at a meeting in Spokane, Wash., Nov. 25. Topics under discussion at this meeting included the United States Mining Laws, Flotation, Land Classification and State and National Co-operation in the Establishment of Bureaus of Mines. C. G. Warsel also talked on the possibilities of reducing iron ore by electricity in the Spokane district. The field of Prof. Warsel's investigations were deposits in Stevens county, which, it is declared, can become the basis of manufacture here if electric power can be obtained within certain limitations.

Mackay School of Mines.—The Short Course for Prospectors at the Mackay School of Mines, University of Nevada, Reno, Nev., which was held with so much success during the past 2 years, will be repeated again this season. This course, which will begin on Jan. 8 and last until Feb. 2, is designed primarily to aid the prospectors of Nevada, but it is open to those engaged in other professions and to the residents of other states. The work of the course includes both lectures and laboratory exercises, and the subjects taken up consist of prospecting, assaying, sale of ores, milling, mineralogy, geology, prime movers, chemistry, hygiene, first-

aid to the injured, and mining law. Those who desire to take advantage of the instruction offered in this course should present themselves at the office of the Registrar at the University on the opening morning, Monday, Jan. 8. No charges will be made for instruction, but a fee of \$5 will be collected to cover, in part, the cost of supplies used during the course. Text books are not required, but certain books will be recommended in each subject.

TRADE PUBLICATIONS.

Duplex Steam Driven Compressors. Ingersoll-Rand Co., New York. Form 3033; pp. 28; illustrated.

The construction of the compressor is described in detail. It is stated that the compressor was designed to operate equally as well with either high-pressure superheated steam or steam under ordinary conditions. In the steam end of the compressor, which is known as type XPV, piston valves are used, and in the air end the usual type of Imperial-Corliss valves are used.

Flexible Roller Bearings for Mine Cars. Hyatt Roller Bearing Co., Newark, N. J. Application Bulletin No. 307; pp. 23; illustrated.

The four methods of housing the Hyatt bearing are classified as Wheel Hub Application; Inside Box Application; Outside Box Application and Anaconda Type. In the pages that follow detailed accounts of these four applications are given with reproductions of blueprints showing plans and sections of the construction. The advantages and limitations of each application are given. In the concluding pages separate reviews are given of the way in which different mine car manufacturers use Hyatt bearings in the construction of their particular cars.

Flexible Shaft and Equipment and Tools Used in Connection With It. Stow Mfg. Co., Binghamton, N. Y. Bulletin No. 102; pp. 107; illustrated.

Emery wheels, drills and similar tools to which the piece of work to be treated is usually applied may often be more conveniently arranged for the work in hand, especially when the piece to be handled is of a large size, and cannot easily be brought to the machine. To accomplish this, this company here describes portable motors which can be brought to the piece of equipment to be worked on. It is connected with the tool desired to do the work, such as emery wheel, drill, etc., by means of a flexible shaft, and thus the tool is applied to the part to be treated instead of that part having to be dismantled and applied to the tool.

INDUSTRIAL AND TRADE NOTES.

The Chicago Pneumatic Tool Co., through its San Francisco agency, sold a 50-hp. oil engine to the Cerise Gold Mining Co., Wilbur Springs, Cal., and a 750-cu. ft. air compressor to the Holt Mfg. Co., Stockton, Cal., for shop uses. J. H. Rylands is the company's San Francisco representative.

P. W. Sothman & Co., New York, announce the formation of the Sothman Corporation, which will specialize in power development and transmission, also in water works. The policy of the parent company of giving its clients the personal attention of Mr. Sothman or Mr. Glaubitz in all engineering problems which it may handle will be continued.

A series of three industrial motion picture films, illustrating the manufacture of "National" pipe, from ore to finished product, will be shown before the National Association of Stationary Engineers at Coplay, Pa., Tuesday evening, Dec. 12. These pictures were taken under the direction of National Tube Co., Pittsburgh, Pa., after 8 months'

work and at an expenditure of thousands of dollars. They are educational, and so realistic that even a novice, after seeing these pictures, may feel that he has started at the Mesabi ore ranges in Minnesota and followed the ore, step by step, until it is shipped out as finished "National" pipe. These pictures will no doubt be of interest to engineers, architects, plumbers and others interested in the manufacture of pipe.

Abr. Levine sailed on Nov. 23 for Brazil for the purpose of buying a supply of carbon. There has been an extraordinary demand for the black diamonds in this country for the last 6 months, owing to the increased activities among mines. Fine carbons are becoming very scarce and there is an outlook for higher prices in the future. In Mr. Levine's opinion there are indications that good carbon is going to bring \$100 a carat.

NEW PUBLICATIONS.

Underground Wastes in Oil and Gas Fields and Methods of Prevention. By William F. McMurray and James O. Lewis. Washington, D. C., U. S. Bureau of Mines Technical Paper 130; pp. 28; illustrated.

By the term underground waste as used in this paper is meant the unnecessary destruction or lessening of the value of underground supplies of oil, gas and water. Points tending to make production inefficient are discussed and remedies for the same given, such as waste caused by bad methods of producing from the well, allowing waters to contaminate the oil or gas strata, etc.

The Mining Industry of Idaho for 1915. By Robert N. Bell. Boise, Idaho, State Inspector of Mines. Seventeenth Annual Report; pp. 134; illustrated.

The report gives a general talk on the mining industry in the state during the year, accidents and their causes, and a review of new installation at mines, mills and smelters in the state during 1915. The geology of the Coeur d'Alene district is gone over quite thoroughly. A review of operations at mines and plants is made by counties and where of sufficient importance the operating company of the mine or plant is given a separate review as regards operations and production.

Geographic Tables and Formulas. By Samuel Gannett, Washington, D. C., U. S. Geological Survey. Bulletin 650; pp. 388.

This bulletin will be found of most value to those interested in surveying and more particularly that branch of the art known as geodesy. For the greater part the bulletin consists of tables though some space is given to the description and practical use of geometric and trigonometric formulas and derivations as applied to geodesy and plane surveying. There are 40 tables in all including tables of logarithms; those for the conversion of time, linear measure, latitude and longitude, those giving data for Polaris computations and the projection of latitudes to plane surfaces, etc.

Handbook of Rock Excavation Methods and Costs. By Halbert Powers Gillette. Clarke Book Co., New York. Book; pp. 825; illustrated. For sale by Mining World Co., \$5.

In no way has the author strayed from the book's designated title, and information on tunneling and shaft work, earth excavation, etc., is entirely omitted. The book deals entirely with things related to the excavation of large bodies of rock, such as methods, machinery and supplies used; classified costs of complete jobs and more detailed operations included in the work. The nature of rocks is briefly described in Chapter 1. In the next 10 chapters drilling machines, methods and costs are dealt with and the concluding chapters go into the details of operation as practiced in various kinds of excavation such as quarrying, canal, trench and subaqueous excavation of rock.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Iditarod.

The Tolstoi camp has again come to light and pay has been encountered on Boob creek. This creek together with Mastadon creek was the center of much excitement during the early spring. Later it was given out that the camp was not so good, but now those who stuck are receiving their rewards.

Kennecott.

At a recent meeting in Seattle of the Mother Lode Copper Mines Co. \$1,000,000 was voted for developments and improvements next year. The improvements provided for include the building of a 12-mile wagon road from the mines to the railway. A concentrating plant is also provided for, and this will mean the employment of an additional force of men. The capital stock has been increased to \$7,500,000, and authority was also given for the issue of \$1,000,000 in bonds.

Fairbanks.

G. A. Aarons, manager of the Fairbanks Gold Mining Co., has stopped dredging operations for the season and will leave for England, where he will spend the winter.

ARIZONA.

Miami.

North Inspiration has been organized by mining and business men of the Michigan copper country to take over 20 claims owned by P. P. Sullivan, who has done the assessment work on them for 9 years. The claims adjoin the Inspiration and Black Warrior properties and a shaft will be started immediately under the direction of H. V. Snell, a mining engineer of Globe, formerly of Hancock, Mich., and one of the lessees of the Black Warrior. The officers are: Williard J. Smith of Houghton, president; J. J. Sullivan of Calumet, vice-president; Bat Quello of Calumet, secretary-treasurer; A. E. Petermann of Calumet; M. W. Goldsworthy, Hancock; Maurice Bandetinni of Calumet and H. V. Snell, the remaining directors.

Jerome.

Two unusually wide and well-mineralized outcrops are to be developed by the Verde Copper Development Co. under supervision of J. E. Leeper. One of these outcrops—a broad belt of iron-stained quartz—follows the course of the great north fault. It samples high in iron and carries traces of copper, gold and silver. The erosion that has taken place here and at other points has disclosed favorable geological conditions. By reason of the greater erosion it is probable the area of commercial ore lies much closer to surface here than it did in the United Verde mine, where the overburden was heavier. The work now being done is purely preliminary, but it will serve as a guide to future operations and as a base for the development of the ground at depth. The deepest shaft is down 85 ft. It shows considerable copper mineralization, and while it is in the sedimentary formation, carries the mineralogical earmarks of making into commercial ore at depth. The slope of the hill adjacent to this shaft, and the gulch below it, are covered with float that has eroded from the outcrop. A permanent camp has been established nearby and in its vicinity will be located the 3-compartment working shaft the company plans to sink. This is to be equipped with powerful and modern mine machinery. The

latter will be freighted to the site via the old ore road to Ash Fork, formerly used by the United Verde Co., and a road the Verde Copper Development Co. will build to connect therewith about 3 miles from Jerome.

A number of recently organized companies are busy south of the United Verde and United Verde Extension mines. The section is one which holds much encouragement and is viewed with favor by the mining men of the camp. The Michigan-Verde Copper Co. is outlining plans for development at depth and expects to have work well advanced before the close of the year. The company holds 310 acres, being located in proximity to the United Verde. It carries the iron gossan and copper-stained quartz characteristic of the country in the vicinity of the United Verde and United Verde Extension. Near the Michigan-Verde the Boston & Jerome Co. is preparing development. A camp has been established and a force of miners engaged. Like the Michigan-Verde, the Boston & Jerome holds promise. It is one of the oldest corporations doing business in the Verde district, but until recently was inoperative. Now, however, it is to at once be developed. Funds for that purpose have been assured and will be available within 60 days. Reorganization was recently brought about with the result that Boston & Jerome has now on its board of directors some of the most capable mining, business and professional men in Yavapai county. Among them is Richard Kingdon, of the United Verde Extension mine. Others on the board are E. S. Clark, attorney of Prescott; J. S. Acker, mining and business man of Prescott; L. E. Hesla, mining and business man of Prescott, and E. C. Farrell, mining and business man of Clarkdale.

Seventy-five thousand shares of the United Verde Con. Copper Co. were sold at \$1 per share on Nov. 23rd, the day the stock was called for the first time on the New York curb. The company's United Verde Junior group is located in the vicinity of the producing mines of the Verde district. Diamond drill operations are being prosecuted and at a later date will be in force on the company's Mahurin group also. These operations are preliminary to development at depth.

The conviction is becoming general in this section that the Jerome Victor Extension Copper Co.'s property will be a producer within a few months. The drive toward the United Verde workings on the 1200 level continues to show favorable copper indications, and the chances are strongly favorable to the picking up of the extension of the United Verde ore body during the next few weeks. The face of the drive shows chalcopyrite and iron pyrites and appears to be nearing the point where a body of copper ore will be encountered. The company has the backing of a number of prominent copper mine operators of the Lake Superior country and has an ample treasury fund. An overburden of water for a time hampered mining operations considerably. Of late, however, the water has been handled without difficulty and the work has been prosecuted expeditiously and to good purpose.

Paradise.

The California mining district situated on the east slope of the Chirichaus mountains is fast taking on activity again after being quiet for a number of years. The district during the 80's was a producer of silver, and it again took on new life from 1905 to 1907. During the panic and the slump in copper in 1907 developments all over the country were curtailed and it is just recently that new life is taking headway and we have at least one property in the district now that will take its place among the producers. It has been under development for more than 2 years now by the Fife

syndicate of Kansas City and Chicago, and their developments up to date have been very satisfactory. They are now expecting their new plant and it will be all installed by early spring, at which time they expect to commence marketing ore. The company is now engaged in building a road to the nearest railroad station at Rodeo, New Mexico, where they will ship to both the El Paso smelter and the copper reduction works at Douglas, Ariz.

The Hall property is also being worked under new management and it is believed that they have a good property and will soon commence to ship ore. This property is part of the old Texas mine that was worked in the 80's.

The Doran and Galligar property is also under bond and leased to Denver parties, and while they are at present shut down, it has been announced that they are in the east financing, and that they will resume work by the first of the present year on a very large scale. This mine has good values in copper and zinc and some in silver and gold, and the engineer who spent several months on the property pronounced it a very attractive prospect. •

The Crys Grauer property has recently been sold and two shifts have been put to work taking out shipping ore from some of the old workings. It is said that work on a large scale will start as soon as machinery has been installed. The property joins the Hill Top on the west and north.

G. T. Colvin has sold his property. The Colvin is a copper property and joins the Hill Top on the east.

The Virtue Mining & Development Co. has recently been organized. The Virtue property which has been under development in a small way for a number of years, has proven satisfactory in every way, and as soon as machinery and supplies can be arranged for and installed development on a larger scale will be undertaken.

The Cochise Con., a very attractive property now owned by C. E. Welch, has recently been examined by eastern capitalists. The development work which has been done in the past has been satisfactory, and more depth will be the next undertaking by parties working the property. The greatest depth that has been attained on the property is a vertical shaft 115 ft. which shows ore from the surface to its present depth. There are several other workings on the property of less depth that show equally as good for the depth attained.

Oatman.

The United Eastern mill will be running at part capacity by the first of January, according to official prediction, and at full capacity of 200 to 250 tons within 30 days thereafter.

New plants are projected by the Tom Reed, Big Jim and Gold Ore companies, and by a syndicate which is heavily interested in Carter and a couple of other properties. The Gold Dust plant, which is trying out a new high-speed crushing apparatus and the Zimmer centrifugal amalgamation process, is undergoing some changes, but will soon be handling 25 tons daily.

The Tom Reed is drawing plans for a new 500-ton mill to handle the ores from its new Aztec mine, which embraces the Aztec, Black Eagle, Grey Eagle and Bald Eagle workings. Supt. Edwin Rabb is designing it, and says that he believes he will be able to mine and mill \$1.50 ore at a profit.

The Big Jim is planning a 400-ton mill, and plans are practically completed. Supt. Keating hopes to equal Engineer Rabb's record as to low mining and milling costs.

The Gold Ore, left without milling facilities when the Gold Road suspended milling operations temporarily, will commence construction of a 50-ton plant not later than Jan. 1.

The Carter interests are planning a 200-ton mill, but plans have not yet advanced to the point where definite information can be given out.

The new Aztec mine of the Tom Reed is being steadily developed and is showing up better every day.

The Big Jim is drifting to the east on three levels, and is daily adding to its ore reserves. Drifts have been carried to within 125 ft. of the eastern end line, showing solid ore

20 to 25 ft. in width, and as the Tom Reed has developed a body of ore more than 25 ft. in width up to within a few feet of the eastern end line of the Big Jim on the same vein, it appears reasonable to assume that the Big Jim ore shoot extends to its extreme eastern end line—a distance of some 700 ft. from the shaft.

The Lucky Boy Co. has resumed operations, but has not as yet put a full crew of men at work, as some preliminary work was necessary after its shut-down of several months. The working force will soon be increased.

Under the impetus of power drills the Oatman United's big 3-compartment shaft is being steadily driven downward, and has now reached a depth of about 200 ft.

The Nellie, after having cut through more than 40 ft. of vein matter by crosscutting on the 350 level, has resumed sinking and will go to the 500 level. The crosscut opened about 17 ft. of pay ore.

The Iowa is drifting on the vein on the 400 level, and values are slowly increasing. The ground was considerably broken where the crosscut was driven into the vein, but is now becoming more solid.

The Ivanhoe has almost completed unwatering its property, and mining operations have been resumed on the 500 level.

Drifting is in progress on the United Northern on the 400 level, with values ranging from \$2 to \$12. The vein is about 50 ft. in width, and a point has not as yet been reached where the values seem to centralize.

The Gold Ore has been refinanced by Hot Springs capitalists, and work is being resumed. The refinancing includes \$100,000 for the construction of the new milling plant. The company shipped several thousand tons of \$20 ore to the Gold Road mill.

The Gold Road company has resumed mining operations, and is exploring virgin ground to the east of its old workings.

The old Moss mine is now being prospected by diamond drills. It is reported to have been taken over by the San Gertrudis Co. of London.

The east drift on the Carter is now in 850 ft. on the 350 level, and a considerable tonnage of ore reported to range between \$18 and \$25 is being developed. The company has been refinanced and work will be done on deeper levels in the near future.

Bisbee.

The Louisiana-Arizona Copper Co. has recently been formed and acquired 31 claims in this district. The officers of the company are D. A. Pressly, president; J. B. Tompkins, vice-president, and R. A. Clampitt, secretary-treasurer. Recently a strike of silver, gold, lead and copper was made. Since, careful investigation has revealed deposits of ore, running as high as \$117.05 copper, \$32.70 silver and \$9.00 gold. Stock will be placed on the market for 30 days in Bisbee before going after outside capital.

Miami.

At Old Dominion work has been commenced on sinking the Kingdon shaft below the 16th level.

Most of the 1200 tons hoisted per day are coming from the "A" shaft. Here on surface, foundations are being put in for the new Diesel engine, delivery of which has been delayed several times. Three shifts are working stringing pump columns in the new concreted pump shaft. The two ends of the west footwall drift on the 18th were recently holed through. Having this connection between the "A" shaft and the farthest west workings improves the ventilation on the lower levels and expedites the handling of ore, etc. The footwall drift going east is making headway. Most of the ore is being produced on the 12th, 14th and 16th levels, while active exploration work is proceeding from the 12th down. On the east side of the mine a raise is being put up from the 14th level under the Grey shaft for ventilation. When this is completed the drift west will be extended toward the Arizona Commercial in order to prospect the vein. A small tonnage of ore is coming from the Grey mine, on the 5th, 6th and 7th levels, No. 3 vein. At the concentrator about 800 tons are being handled daily. The flotation plant is handling a daily tonnage of 400 tons. At the

Oliver filter plant a new thickener has been installed which will give better settling capacity. Plans are being made to install a new flotation plant on the lower floor of the old unit of the concentrator. At the same time a blacksmith shop and carpenter shop will be put in on the same floor.

CALIFORNIA.

Jenny Lind.

J. W. Plant, Insurance Exchange building, San Francisco, has taken a 3-year lease on Plymouth Rock mine. A gasoline hoist has been put in and some gold and silver ore is being shipped. The ore carries lead and zinc also, and it is probable that a mill will be built for concentration by oil flotation.

Angels Camp.

Angels Camp Deep Mining Co. has been organized to take over, explore and develop the old Pioneer mine, which adjoins the Gold Cliff of Utica Mining Co. An electric hoist and air compressor have been put in position, and sinking a new shaft is in progress. No lateral development will be done till a depth of 500 ft. is reached. In old workings, at 130 ft., shoots of ore were found, and a 12-ft. vein was opened containing rich stringers of gold ore. The inclined shaft on Gold Cliff is down 2200 ft. and the Angels Camp Deep have plans to reach similar depth. Officers of the new company are: E. P. Brinegar, president; Elgin Stoddard of Chas. C. Moore & Co., vice-president; J. H. Hopps, engineer; Kenneth McDonald, and Mr. McCarty of Sherman, Clay & Co., are interested. All are San Francisco men.

Ingot.

Reports received from the east are that the Afterthought Copper Mining Co. has been financed and that new equipment is to be purchased and installed for a plant to recover copper, zinc, gold and silver in the ores of that mine. The methods to be adopted, while practically decided upon, are not given out.

Portola.

Operations have been started at the Bonita copper mine, about 24 miles from Portola, by the Walker Brothers Con. Co., of Salt Lake. A compressor and other equipment has been installed, also three machine drills. It is planned to press developments during the winter, and ore shipments to Salt Lake will begin in the spring. Electric power will also be brought to the mine as soon as the dry season sets in. The Bonita lies a mile from the Walker copper property and has been undergoing development for 4 years. A good camp has been established. H. L. Allread is superintendent.

The Boca & Loyaltan railroad is to be extended 5 miles into the Grizzly Creek country, facilitating easy communication with the Walker mine. Construction is to commence at once. The road is controlled by the Western Pacific Co. and its building will stimulate the working of numerous copper and gold prospects. The Walker property is being worked by the International Smelting Co. The 100-ton flotation plant is reported to be making a high metal recovery, and its capacity will probably be greatly increased early in the coming year.

Crescent Mills.

The Crescent gold mine is being rehabilitated by the Philadelphia Exploration Co. Considerable mine equipment is to be installed, and the old mill replaced by a modern reduction plant. The Crescent has been developed to a depth of 400 ft. and formerly ranked among the richest gold producers in the state. Albert Burch, formerly of the Goldfield Con., is manager, and A. Buckbee superintendent.

Alleghany.

The new 5-stamp mill has been placed in commission at the Mariposa and is effecting a satisfactory gold recovery. The company is prosecuting work in the Mariposa and Ophir claims, and has a large tonnage of good ore ready for the stamps.

The Osceola mine has been acquired by R. C. Gillespie and associates of Pittsburgh, and is being equipped with the

plant formerly operating at the Spoon property. By Dec. 15th Manager Dan McGonigal expects to have everything in shape for extensive work. Rich ore has been extracted from the Osceola at intervals, and ore indications are considered favorable for the making of a good mine.

Amador City.

The output of the Original Amador mine has been increased from 150 to 250 tons per day, following installation of two Hardinge mills in the plant. A higher gold extraction is also announced. On the 850 level several good shoots have been opened, and a large tonnage of profitable ore has been blocked out in this section of the mine. The mine lies between the Bunker Hill and Keystone properties.

Sutter Creek.

The hoist formerly operating in the winze on the 2900 level of the Central Eureka has been moved to the 3100 level, and sinking of the main shaft an additional 200 ft. has begun. New levels will be opened at the 3300 and 3400 points, and drifts extended east and west with a view to the intersection of two ledges that are thought to parallel the main ore body. Ore of fair grade is being mined on the 2800, 3000 and 3200 levels, and the management expects to keep 20 of the 40 stamps in operation while shaft sinking proceeds.

Jamestown.

The Harvard mine has been taken under option by an eastern syndicate headed by W. J. Loring, and a thorough examination is being made. For more than a decade the Harvard has been one of the largest and most consistent of Mother Lode producers, and late work in the deeper levels is reported to have been encouraging. The mine is equipped with a 60-stamp mill and large mine plant.

Sonora.

A small flotation unit has been placed in commission at the Dutch-App group, operated by W. J. Loring and associates. It is the first flotation plant of commercial character to be operated on the Mother Lode, and the results are being followed with keen interest, as many Mother Lode properties are hampered by the lack of suitable equipment for economical treatment of low-grade sulphide ores. Splendid ore has been opened at several points in the Dutch, App and Sweeney mine since Loring and associates acquired control, including a particularly fine vein in the 130-ft. winze from the 1800 level.

The California Gold Mining & Development Co. has bonded from F. A. Wenzel of Sonora the Chaparral mine, southeast of Tuolumne. Several adjacent properties have also been taken under bond and will be thoroughly explored. The Chaparral has a good record. A compressor and drills have been ordered, and development of a wide area of promising ground will be pressed.

The Bonanza mine, in the heart of Sonora, has been taken under bond by J. B. Curtin and George Weston. It has produced upward of \$2,000,000 in pocket gold, and large areas of promising territory remain to be exploited.

Callahan.

New mine equipment has been installed at the Oro Grande, formerly known as the McKeen, and arrangements are being made to provide an entirely new milling plant, employing a process for treatment of the somewhat refractory ore. Twenty men are employed and development of good territory is being carried on from the lower tunnel workings. W. L. Fraser is superintendent.

Porterville.

More than 700 men are engaged in mining of magnesite and its allied branches in the Porterville district. Three calcining plants are now in operation, the \$50,000 plant of the American Magnesite Co. starting up last week. The plant has a rated capacity of 65 tons per day, making a total of 125 tons daily for the district. Mining developments are very active, and several important discoveries have been lately announced.

Mokelumne Hill.

At a depth of 50 ft. a 6-ft. vein, said to assay \$200 in gold, has been uncovered in the Garibaldi mine, located in the Jesus Maria district, 8 miles from Mokelumne Hill. The

property is owned by the Gardells brothers, and is being worked under bond by W. P. Young and William Stovers. Considerable fine gold is present, and much decomposed quartz occurs.

Grass Valley.

The Grass Valley Con. Co. has announced that unwatering of the Allison Ranch mine will be completed within 2 weeks. Construction of the mill is proceeding rapidly and the management expects to have the stamps dropping on good ore early in the coming year.

COLORADO.

Lake City.

The Colorado-Utah Operating Co. is doing extensive new work in connection with its mill at the Golden Fleece mine. Within 90 days the recently ordered Hardinge ball mill, 100 tons capacity, will be installed. In the meantime the flotation process for the treatment of milling ore, which carries gold and silver with substantial values in copper and lead, will be completed. The new plant will have a capacity of at least 100 tons. Pending its installation, development will be prosecuted.

Palisade.

A company has recently been formed to work shale beds here which contain oil. Richards and Flinn originally owned the claims which are on Dry Fork creek. The company estimated that it can separate the crude oil from one ton of rock for about \$1 and that the crude oil will be worth about \$10. With a small retort which it has constructed it has averaged 81 gals. of oil to the ton. The oil contains a large per cent of kerosene, gasoline, etc., and the remainder has been classed by a Denver chemist as good oil for flotation. What is known as the first unit of the Scott system of separating the oil from the rock, which consists of 6 retorts, will be installed. This system when completely installed will cost \$10,000.

Leadville.

At the Leadville Unit several veins of zinc carbonate have been cut in the Jamie Lee which will start producing by Jan. 1. A steady production of carbonate is being made from the Tip Top. The Jamie Lee shaft is to be sunk further. It has been drained to its present depth and work is now under way cutting a station at the bottom. As soon as this is finished a plant of pumping equipment will be installed and sinking started again. Because of the favorable indications uncovered in the upper workings the plan to lease out certain parts of the Jamie Lee has been abandoned. It is now determined to prospect the property on company account. The Harvard, Tip Top and Jamie Lee shafts have been equipped with a system of air lines from the Harvard to all the important workings of the company. Development will be taken up in several of the most promising places of the Tip Top and Jamie Lee.

Operating with a Layne-Bowler electric sinking pump, the water in the Greenback has been lowered from the 900 to the 1200 level. At this latter level, however, an unusual amount of water is now coming in which is puzzling because nothing similar occurred when the property was previously unwatered.

About 450 tons are now being shipped daily from the Garbutt and Ihex mines, which is considerable larger than has prevailed for several years. A good body of low grade gold has been opened on the C. & G. lease of the Ihex. Development on this shoot continues to the south and new ground opened. The tonnage of copper ore is becoming an important factor in the Ihex. Several leasing companies have opened strong veins of copper averaging 8%. Under the present price for copper, this product is rivaling the gold output. High grade carbonate of zinc is also being mined.

Ouray.

The Barstow mine has been let under lease and bond to C. R. Wilfley and Chicago associates. W. A. Sheldon will be superintendent. The new lessees will continue development on the bottom levels during the winter on a fairly large

scale, with the intention of greatly extending their operations next spring. Several old filled stopes will be investigated. If promising the 40-stamp mill will be overhauled and a fine grinding machine and flotation process installed.

Breckenridge.

The mill of the Pioneer Con. Mines Co. has been completed and is now operating. At the Wellington, while sinking the shaft to encounter the Oro vein a new vein of fair promise was encountered. By a new roaster, making two in the roasting plant, the capacity for increased shipping was provided. A new addition has been built for the accommodation of the flotation plant, which is to be enlarged. New ore bins have been completed recently which provide ample storage room. The new boarding house is among the latest surface improvements.

Tonopah is drifting from the bottom of the Miller shaft across the gulch from the Wellington. The work is inspired by the probability of cutting either the Oro vein or another vein the existence of which is assured by exposure of the vein during dredge operations in the past.

Rico.

The Gold Anchor has made its first shipment and it is understood that plans are being laid for extensive work for next year to cut the ore body at a much greater depth by a tunnel 500 or more feet in length.

The plant of the Rico Argentine is now running smoothly. Two drifts are being run from the main tunnel. Strong mineralization indicates that the copper shoot must be close. This shoot was developed in the old workings. Both drifts are about 600 feet in and are in limestone. At each face 8 ft. a day is being made with the new power drills. The work is 180 ft. vertically underground and 300 ft. on the dip. Some samples were taken from the faces of workings Nos. 406, 405 and 404. The first group showed copper and the second lead and zinc.

IDAHO.

Mullan.

Plans are being perfected by the Gold Hunter Mining Co. to increase the capacity of its concentrator and install separate treatment systems for ore now being produced. It is said that the new unit will be devoted to treating the lead ores and that the old plant will be remodeled to handle the high-grade silver product.

George R. Trask, of Wallace, has been busy the last week at the Carbonate Hill mine, near here, making surveys and laying out work for the contemplated long lower tunnel, starting at the railroad to tap at greater depth the ore bodies disclosed in the upper tunnel. This new tunnel will be about 1900 ft. long and give a vertical depth at the ore body of 850 ft. below the surface, 240 ft. below the present workings, and a stoping back on the vein, below the present workings of 275 ft. Judging from the fine showing of galena-zinc ore in the present workings, when this new tunnel reaches the ore, the mine should be among the prominent shippers. Estimates are also made for a new compressor, installing of electric power, and other improvements.

Burke.

Resumption of development is planned by both the Ajax and Ambergris mining companies, adjoining the Hercules. The Ambergris mine, owned by the Ambergris Mines Co., whose capitalization recently was reduced from 3,000,000 shares at \$1 each to 1,000,000 shares, is regarded as a promising non-productive property. The Ajax also is to be opened at depth, according to H. W. Woodward of Lynn, Mass., vice-president of the Ajax Co.

Kellogg.

Construction of the Bunker Hill & Sullivan Mining Co.'s new \$1,000,000 smelter at Kellogg is progressing rapidly, according to Stanley A. Easton, general manager, and the plant probably will be completed and operating on schedule. The superstructures for the furnace and refinery buildings are being raised, the main stack is rising fast, and construction

in other departments is being rushed. An average of 275 men are employed in the work, and the force probably will be increased as installation of the equipment progresses.

Adair.

More than a car of ore a day is being shipped from the Richmond mine, fifteen 4-horse teams being employed transporting the product to the railway at Saltese, Mont., and it is believed that operations can be maintained throughout the winter, with a possible exception of a short time when the ground begins to thaw next spring. Extraction now is being made through the main shaft. Short tunnels already have been extended from both the Montana and Idaho sides of the mountain on which the property is situated. Officials state that 35 cars of ore have been shipped since September, the settlement ranging from \$1300 to \$2200 net to the car.

Black Bear.

Resumption of operations at the Black Bear property is contemplated. The company recently took a lease on the Western Union Mining Co. mill, west of Wallace, for a year, commencing Jan. 1, with the privilege of adding new buildings and machinery to the plant necessary to handle the Black Bear ores, which are a lead-zinc product. It is estimated that from \$15,000 to \$20,000 will be required to place the mill in a condition with a capacity of 125 to 150 tons. It is also contemplated to expend approximately \$20,000 in new equipment, which will include a larger air compressor, drills, steel-sharpener, cars, bins, air pipe, fans, crushers and railroad siding.

Hope.

The Hope Mining & Milling Co. has recently been incorporated to continue the development of the Morning Star group. Considerable work has already been done with excellent showings having been encountered. The property is located about 3500 ft. from the main line of the Northern Pacific railroad, and from the lines of the Northern Idaho and Montana Power Co., which gives splendid transportation facilities and cheap power. A small stream passes near the workings and there is an abundance of timber for all mining purposes. There are five nearly parallel veins of mineral bearing quartz on this group of claims cutting the formation at a sharp angle and on a clean contact. The Big Ledge is from 4 to 6 ft. wide at the outcrop, and stands nearly perpendicular. The general character of the formation shows a marked similarity both in texture and color to the main Coeur d'Alene region. There are no indications of local disturbances or faults.

The veins have been tested by 23 open cuts all of which show mineral-bearing quartz in places. The present development consists of 313 ft. of tunnel, by means of which the veins have been cut at depths ranging from 70 to 124 ft., exposing in these workings two veins of copper sulphide ore of a shipping grade, while at Big Ledge about 30 ins. is of a good grade of milling ore. The largest of the veins of shipping ore has been explored by a drift for a distance of 50 ft. disclosing its continuity for at least that distance, with a width of from 5 to 12 ins., and giving every indication of the lens increasing in size as depth is obtained. The ore from this lens averages \$60.

A good road has been constructed from the railroad to the tunnel site. The development now being undertaken consists of a 1200-ft. crosscut which will encounter all of the veins at depths ranging from 350 to 500 ft. The company is capitalized with 1,500,000 shares of a par value of \$1 each, of which over 900,000 remain in the treasury. The officers are: Hon. G. H. Martin, Sandpoint, Idaho, president; A. W. Bowen, cashier 1st Nat'l Bank, Sandpoint, treasurer; John Parson, Hope, secretary. The directors are all well-known local business men.

LAKE SUPERIOR.

COPPER.

Houghton.

Isle Royale has raised its daily tonnage up to 3200, or at the rate of 80,000 tons a month, but the actual figures will

be nearer 77,500, which though the daily rate is high, about 3100, is somewhat low, as there are only 25 working days, since election day was a holiday. The profit for the month should be about \$141,000, or at the annual rate of over \$10 a share. The wooden rockhouse at No. 5 shaft will probably be completed in February, and the crew will be transferred to building a similar wooden rockhouse for No. 6. A large amount of development work is in progress, as the mine located within a mile of Houghton, gets and holds its men better than the more remote properties. Nos. 4 and 5 are the best of the shafts, and as they have been opened quite extensively, there is every reason to believe their good quality will continue with length and depth.

Copper Range is steadily hoisting its 5800 tons daily, which is its normal, the mines having all the men that are needed. It has purchased recently from the Denver Rock Drill Co. 25 Dreadnaught drills, and 50 of the Clipper pattern. It has now three diamond drills at work at the tract of land taken under option from the St. Mary's Co. and lying south of the Globe.

Wyandot will in a short time make a mill test of the rock it has accumulated. It is drifting both ways on the 10th level in excellent ground, and is getting good rock from its two stopes on the 9th level. Its rock will probably be milled in a mill that regrinds the tailings, as it needs this treatment to get the fullest possible recovery.

Osceola Con. will have about 110,000 tons for November, or about 4400 daily, and this a very good figure considering that the Osceola and North Kearsarge are quite a distance from the larger towns. Ahmeek is making just about the same figure as the Osceola counting the La Salle rock, which is about 7000 tons monthly.

Michigan has made three cuts on the Evergreen lode with great success, there having been taken out of the last one about 700 lbs. of mass copper, one piece weighing over 200 lbs., with the face of the drift still in the same average quality, and also a good amount of stamp rock. On the Ogimah lode the ground in the drifts was poorer than the average for the week ending Nov. 25th, but beginning with the 27th it has been better. On the raise in the longitudinal vein lying above the Butler lode, but which may be the hanging-wall of the latter, there has been copper in good quantities all the way up from the 6th to the 5th levels, where the work is stopped waiting for the drift to be opened 35 ft. in from the shaft. In the west drift the diamond drill searching for the lode beyond the fault encountered 2 or 3 weeks back, is being kept up.

Centennial has reached the 18th level with its No. 2, and one skip way of its No. 1 shaft the latter being used only for men and timber; and has drifted from No. 1 past No. 2 north into rich ground. As was indicated on the 17th level the mineralization has extended south across No. 2 shaft southerly, making the property of much greater extent than it appeared to be. The copper is quite evenly distributed through this northern part of the mine as far as it has been exposed by drifts, and its eight or more "forties" will make a good sized mine, when the proper time arrives for it to be worked to its greatest advantage.

Keweenaw Copper shipped on Dec. 1 about 40 to 50 barrels of mineral, and about 2 carloads of mass, to the Quincy smelter.

Quincy has run its daily output to between 4300 and 4400 tons; great care is taken to keep the reserves up to the proper figure all the time.

Lake, on the Knowlton lode, will soon have a new Ingersoll-Rand compressor with a 10-drill capacity. At the older part of the mine there has been a slight increase of tonnage for November, which will be approximately 8000 tons.

Mohawk will make in November a slight increase of its tonnage over that of October which was about 63,000 tons, or 1,239,500 lbs. of refined copper; and Wolverine's figure for November will be just about the same as that for October, which was 27,174 tons, or about 405,500 lbs.

Calumet & Hecla is keeping up a very good rate of tonnage, as its figures for the past few days have been about

10,520 tons, which is a decrease of about 300 tons from the figures given about 3 weeks ago.

Indiana is now down about 100 ft. with its shaft on the Butler lode and is finding some copper all the time.

Houghton Copper has discontinued its northern drift on the 12th level since the continued extension is so expensive as the "dirt" has to be trammed over 100 ft. to the winze, drawn up in a bucket to the 6th level, trammed to the shaft 250 ft. away, and finally hoisted up to the surface. It is, however, cutting into some of the ground already opened there with high grade disclosures. It is probable that the directors will soon decide whether they will extend the shaft down crosscut over to the lode and mine it.

White Pine Extension will sink from the 100 level to the 200 and open up the drifts. The party of directors, who were here recently, were very much pleased with the high grades of rock that were being met with at the drift on the 100 level, as they fully justified, the expectations that followed the getting of such good drill cores.

Mass will increase its output for November somewhat over that of October, which was about 27,000 tons, a little more than 1000 tons a day. Conditions underground were never better and more men could be at once put to work stoping to bring the tonnage figure to its maximum, if they were to be had.

South Lake is taking out about 125 tons a day and hopes to soon increase the production.

IRON.

Marquette.

A saw mill for the handling of wood for the charcoal retorts of the Pioneer Iron Co. will be in operation by March, 1917, and the 20 new retorts have been put in operation. At the new mill logs will be shipped in as felled instead of being cut into 4-ft. lengths in the woods. The equipment of the mill will be three 6-ft. band saws and a 4-saw Prescott slasher, equipped with 72-in. circular saws. The logs will be rolled from the banking ground into a conveyor that will carry them to the slasher, which will cut them into 4-ft. lengths. The smaller wood, of retort size, will be diverted from the conveyor, and the larger sizes will be carried to the band saws, where they will be cut up for retorts.

Iron Mountain.

The Peninsular Power Co. will soon commence a transmission line to the Indiana mine from Twin Falls. The mine will require about 350 electrical horsepower for operating pumps, crusher and hoist. An electric haulage system also is to be installed underground.

MISSOURI-KANSAS.

Joplin, Mo.

So far as could be learned last week \$105 was the top basis price being paid for zinc blende. Sales at this price were reported few, many producers declaring they would not sell for this figure, but hold for a higher price. Lead ore remains unchanged, as well as silicate.

The power plant of the Empire District Electric Co. at Riverton, was further crippled at 12:35 o'clock Saturday morning, when a short circuit developed in one of the turbine generators, causing a complete burn-out and rendering it practically useless. Another large generator near the burned one was damaged to such an extent that it is out of service. It will be a week before these turbines can be replaced, and all mines using electric power will be forced to shut down, further curtailing the output of ore, and for this reason higher prices are expected by producers.

The Fighting Wolfe Mine at Zincite, which went into the hands of J. A. McConnell as trustee, has become a prolific producer, zinc concentrates being made now at the rate of 3 carloads in 2 weeks. At present there are a total of 12 drifts in ore being worked at the property. These drifts are on two levels, six of them being at 65 ft., the upper level,

and 6 at 84 ft. The company is said to be planning a new concentrating plant a short distance to the southwest of the present mill. Drill holes in this vicinity were exceptionally good and the fine run of ore that has been shown recently leads the company to believe that there is plenty of need for another mill.

The first barrowful of concentrates to be mined at the new mill of the Latoka Lead & Zinc Co. was thrown into the bins Saturday. The mill was started in the morning. This property is owned by Jess Short, who says they have a 17-ft. face of ore at the 200-ft. level which runs 15% blende. The mill is 150-ton capacity.

Construction of a new concentrating plant has been started by the U. S. Paymaster Mining Co. on the Lewellyn land north of Bell Center. It will be a steam plant of 150-tons capacity per shift, is being built under contract by Goettel & Carrow Brothers, and it is to be completed in 55 days. This property was opened up about a year ago by the Wassermann Mining Co. as a lead prospect.

Another shaft has been put down by the Independent Mining Co. at Bell Center. Excellent dirt is being taken from a 98-ft. depth.

Miami, Okla.

A company composed of Webb City and Carthage men have taken over a large lease between Quapaw and Commerce, which is being drilled and developed. The tract consists of approximately 745 acres. If the land proves up the company will erect a new \$600,000 mill. The following are interested: George W. Moore, J. F. Wingfield, S. C. Bird, Thomas Hill and James Richards of Webb City, and Richard Holden, John Bailey and L. Gerald of Carthage; Holden is fee owner of the land.

Rich ore has been encountered in a shaft on what is known as the Blue Jacket mine near Cardin. This mine is on a 40-acre lease, on which nine drill holes have been put down. At the bottom of the shaft, as far as it has been sunk, ore, lead and zinc could be picked up by the handful.

The Lucky Jew Mining Co. is drilling extensively on its newly acquired 80-acre tract in the Cardin district. Three drills now are in operation and have already revealed good runs of ore at about the 280-ft. level. The following are interested: A. B. McCormick, W. W. Hubbard, Herman Strauss, J. H. West, Chas. Veteto, Ira Smith, Hal Mitchellson, A. J. Goldberry, J. W. Watson, Roy Redman, Frederick Wilson and F. M. Thompson.

The Admiralty Zinc Co. in the Century field has erected three new mills since it took over a 100-acre tract of land in the vicinity of the Big Welsh properties in the last year. Two of the mills are of 200-ton capacity, while the third is capable of handling 125 tons. The tract procured by the company was developed by Church & Mahon. Extensive drilling activities were made by the fee holders before subleasing the tract to the Admiralty zinc. At the present time the company has six shafts in ore, all of which are producing big. The ore is of exceptionally high grade, assaying from 60 to 84% metallic zinc content. A carload of ore recently sold assayed an average of 63.80%.

Announcement has been made of the sale of a 20-acre lease adjoining the Croesus property at Cardin, by the Dewey Howard Mining Co. of Miami to a Kansas City company. The consideration is reported to be in the neighborhood of \$35,000. Drilling operations have been under way for some time and a shaft was started some weeks ago and now is almost down to ore. A total of 11 drill holes have been put down and all show an ore face of approximately 30 ft. in height at a depth of about 205 ft. It is understood the new owners of the property will push the work on the shaft and as soon as the ground is fairly well opened up will erect a 250-ton concentrating plant. This deal is one of the most important reported in the Oklahoma field for several weeks.

The U. S. Mining & Smelting Co. has completed a 300-ton mill on a 65-acre tract of land near Cardin, adjoining the Blue Goose mine on the northwest. The ore faces vary in size from 15 to 23 ft. at the 250 ft. level. The plant is one of the best equipped in the district, coal being used for fuel, four large 150 hp. high-pressure boilers supplying steam.

MONTANA.

Butte.

The Anaconda Co. has posted the following notice: "Notice to Employees: Without altering or changing any existing contracts or obligations, the Anaconda Copper Mining Co. will, as long as the average monthly price of copper remains 27½ cts. per pound, or more, increase the wages of all employes paid on a daily wage rate, at the mines at Butte and the reduction works at Anaconda and Great Falls, 25 cts. per day. This increase is made effective, beginning Dec. 1, 1916, and shall apply to settlements made for services rendered from and after Dec. 1, 1916." The increase means that miners will receive \$4.75 a day while the price of copper remains at 27½ cts. or better, and that salaried employes who receive \$300 or less per month will receive an additional raise of 5%. The wage increase applies to the employes of the Anaconda Copper Mining Co. at Anaconda and Great Falls.

Federal Judge George M. Bourquin, in a decision handed down, has denied the petition of the Minerals Separation Co. for an injunction restraining the Butte & Superior Co. from distributing its enormous profits to stockholders, disposing of its assets and enlarging the plant with which it reduces its zinc ores by the oil flotation process. The court also discharged the Butte & Superior Co. from the order issued Nov. 14, 1913, requiring it to post a bond in the sum of \$75,000 to secure a possible judgment for infringement of patent on the oil flotation process, and requiring monthly reports of the results of this process at its mill.

The decision is a sweeping victory for the Butte & Superior Co. so far as this phase of its controversy with the Minerals Separation Co. is concerned, although the question of infringement of patent itself is now with the United States Supreme Court, where it was taken on a writ of certiorari immediately after the circuit court of appeals reversed Judge Bourquin's findings and declared the Minerals Separation patent void because of lack of novelty.

Refusal of the Minerals Separation Company's petition for injunction and granting of the Butte & Superior Co.'s motion for discharge of the restricting order of Nov. 14, 1913, means that the Butte & Superior Co. may now go ahead with its plans for enlargement of its mill with a view of greatly increasing the capacity. These plans have been held in abeyance because of the court's restriction on use of the patent process to the extent to which it was being used at the time the order was made. When news of the decision reached the offices of the Butte & Superior Co.'s attorneys, Sanders, Kremer & Sanders, word was telephoned to General Manager J. L. Bruce and work was immediately started on the deferred plans for enlargement.

This latest decision brings the present status of the Minerals Separation-Butte and Superior litigation down to the point where it is up to the supreme court to decide whether or not use of oil flotation for reduction of ores is an infringement of the Minerals Separation patent. Judge Bourquin held 3 years ago that it is. The circuit court of appeals held that it is not.

The suit against the Butte and Superior is based in large part upon the contentions in the Hyde case, an immediate parallel. After the Minerals Separation Co. had appealed from the circuit court's decision to the supreme court of the United States, it filed a motion a few weeks ago in the federal court here to increase the Butte & Superior bond so that a possible judgment might be secured. The Minerals Separation Co. contended that profits of the Butte & Superior from use of the oil flotation process had mounted up to a figure approximating \$15,000,000, and that \$13,000,000 of these had already been distributed to stockholders. They contended that the Butte & Superior was disposing of its assets to such an extent that possibility of collecting a judgment in the amount which might be expected was jeopardized.

Dillon.

There is considerable excitement in Argenta over the uncovering of a vein of high-grade copper ore which was struck

in the Jack Rabbit mine. The news was brought to Dillon by B. C. Crowley, who states that the vein is 14 ins. wide and runs 15% in native copper, from 20 to 30 ozs. silver and from \$1.50 to \$4 in gold. Under the supervision of Jack Conda of Butte, a small crew of men have been employed at the mine for several months. Extra men have been put on already, and Conda was in Argenta Saturday to get lumber for the construction of an ore bin. The company that is operating the mine contemplates putting a larger crew of men to work immediately and will begin shipping ore to the concentrator within a few weeks.

Great Falls.

The third unit of the new zinc smelter is in operation, which gives an output of 100 tons of zinc per day. The fourth unit, manager Frederick Laist says, will be ready by the 15th, and the fifth and last unit will be completed and in operation by Jan. 1. The five units will give an output of 9,000,000 lbs. of zinc per month and will in addition to caring for all of the concentrates of the Anaconda Co., enable it to handle concentrates from other districts. The Anaconda is now purchasing concentrates from Idaho, in addition to a much larger output from its own mines, and expects to keep the new plant working to full capacity. With the completion of this third unit the temporary plant at Anaconda, which was evolved from the original experimental plant, will be abandoned and the men employed there will be transferred to the Great Falls plant.

NEVADA.

Goldfield.

It is officially announced by the Goldfield Con. management that operations with flotation will be resumed about Jan. 1. At least one 500-ton unit will go into commission on that date, and the second operated as soon as possible. A 50-ton unit has been in steady operation on gold-copper ore from the Laguna mine with satisfactory results, and reports that the process has not been successful are refuted. The additional equipment for the flotation plant has arrived and is being installed. Underground developments are being prosecuted, with good results. Arrangements have been made to run about 700 tons of tailings and ore through the cyanide plant daily, as soon as the flotation mill goes into service.

Two crosscuts are advancing into virgin ground from the 1100 level of the Silver Pick shaft. The east crosscut has intersected several parallel seams of good quartz, and the management believes indications favorable for development of a strong ledge in this area. The west crosscut is being driven to intersect the numerous ore shoots indicated by the Calyx drill, and within a few weeks important disclosures are anticipated.

The Florence mine has been placed in the hands of a receiver. It is understood the principal owners are contemplating a reorganization of the company and the raising of finances for work below the 650 level where large deposits of copper-gold ore are indicated.

The east crosscut from the 320 level of the Cracker Jack is advancing rapidly, and is expected to intersect the Columbia Mountain fault vein within 10 days. This vein has yielded much good ore and hopes are entertained for discovery of profitable quartz. Considerable work is going on in the upper levels, and the shaft has been thoroughly repaired.

Battle Mountain.

Copper Canyon Mining Co., operating the old Glasgow and Western mine, is shipping 3 to 4 cars of ore per week, which runs about 12% copper. F. Sommer Schmidt is manager.

Yerrington.

Everything is commencing to take on new life in the Yerrington field, embracing the Luning, Mason, Reservation and adjacent districts. Work has been resumed in the Mason Valley mine, and at the smelter a force of mechanics is busily engaged in placing everything in shape for early

activity. It is understood the plant will be blown in as soon as sufficient coke and other supplies are on the ground, some delay resulting from the car shortage. The Delamar interests have started operations at the Bluestone group, with C. A. Weck in charge. It is understood this company has contracted to ship a heavy tonnage to the Thompson plant. The Western Nevada, Malachite, Walker River, Montana-Yerrington and several other properties are being placed in shape for early production. It is rumored the smelter will handle a large tonnage from the Balaklala mine, located near Coram, California.

Pioneer.

The Pioneer Con. is arranging to operate its property along broader lines and has engaged A. J. Canava, formerly with the Goldfield Con. Mines Co., to superintend operations. In addition to company work, four sets of leasers are active, and several new leasing applications are being considered. It is planned to install additional mill equipment, including apparatus for treatment of the slimes.

Jarbidge.

The Long Hike Co. has installed a gasoline power plant on the Jarbidge river and is erecting an electric hoist at the mine. This will be used to sink a 500-ft. winze from the lower adit. An incline tramway has been erected to facilitate shipment of supplies to the mine from the river landing, the power being furnished by a gasoline hoist. A large tonnage of good ore is exposed in the main workings, and it is understood reduction facilities will be supplied as soon as summer sets in.

Dayton.

The gold dredge of the Rea Con. Co. has been placed in operation and is moving 12,000 to 14,000 cu. ft. of material daily. Tests indicate the placers are among the richest being worked in the west by the dredging process, and large areas of virgin territory are available. The dredge cost approximately \$20,000 and is expected to pay for itself in a few weeks.

Carrara.

Finished marble is being shipped from the quarries of the American Carrara Marble Co. for the first time. The present output is largely blue and white.

NEW MEXICO.

Lordsburg.

Leo XIII Mining Co. has struck considerable water, which was more than could be handled. The company is now driving a tunnel which will strike this ledge at a depth of 300 ft. and this will unwater the mine. The entire property can be worked from this tunnel. The company is preparing to put in an air compressor. In shaft No. 3, at the 100 level, there has been made an important strike in the crosscut south. A body of ore 30 ft. wide was encountered. The ore on the hanging wall runs from 3½ to 12% copper. The ore on the foot wall consists of red oxide, copper glance and native copper. The entire ledge will average about \$6 in silver and \$8 gold.

The Lyons-Atlas Co., Indianapolis, Ind., has installed a new diesel engine at the property of the Eighty-Five Mining Co. which is now running smoothly.

Mogollon.

Wm. Childs, Jr., president of Socorro Mining & Milling Co., and W. Rowland Cox, consulting engineer, made a tour of inspection over the company's properties the past week.

The new shaft on Johnson mine is down about 270 ft., with sinking still in progress. Most of this work has yielded mill ore which is awaiting burros for packing to custom mill.

The Oaks Co. is arranging for another shipment of ore obtained from development work on the Clifton mine, part of the Mother Lode group.

Henry G. Fergusson, of the U. S. Geological Survey, has just finished a complete geological survey of the district, the work occupying the past several months.

The Pacific aerial tramway to the Socorro mill was

placed in regular commission the past week. The dump of lower-grade ore, accumulated the past few years, is now being disposed of by tram.

Lordsburg.

A party of capitalists are inspecting the properties of the National Gold & Silver Mining Co. in the Kimball mining district, north of Steins. In the party are Judge Mark R. Sherman, of Chicago, president of the company; A. R. Lawton, of Iola, Wis.; M. L. Wehrly, of Perth, N. D.; F. W. Jacobs, of Port Byron, N. Y.; W. C. Norse, of Russellville, Ky., and Daniel Minor, of Franklin Grove, Ill. Extensive development of the property may follow the visit of the party.

Silver City.

At the Cleveland camp an additional mill is nearing completion. It will use the flotation process. A Diesel engine for the power plant, making two of these engines for the Empire Zinc Co.'s plant, is now being hauled to the camp. The Cleveland mine is producing steadily and regular shipments made.

OREGON.

Drewsey.

The Idyl City mines will be operated all winter. A large crew has been taken on and the ore will be stocked until spring when shipments will be made via Crane to Salt Lake City smelters. The property is owned and managed by J. Darst, who has a good body opened carrying gold, silver, lead and zinc values.

Sumpter.

At the Cougar trouble was recently met with by the freezing of the pipe line. A pump has since been installed and water is being pumped from Granite creek, a distance of 1 mile over a ridge 400 ft. high. This will keep the mine going until the pipe line can be opened.

Good ore has been encountered at the Ben Harrison but the operators desire to develop it further before giving out details. A raise goes up at the edge of the ore and a drift is now being started which will show something of the extent of the strike.

SOUTH DAKOTA.

Hill City.

The Golden Summit, which was unsystematically worked in the early days at shallow depths, is to be developed by the Dakota Continental Copper Co. The Columbia mine is shipping. Teams are hauling ore from the Cowboy tin mine to the railroad spur which was recently completed to the mill.

Lead.

The Homestake Mining Co. has purchased the property of the Cascade Water Power & Electric Co., located on Spearfish river. Homestake it is rumored will build another hydro-electric plant on this ground.

Sinking is to be resumed at the Oro Hondo and Custer Peak mines. At the former the 3500 level is the objective. The shaft is now 200 ft. deep and in past months a great deal of diamond drilling has been done. The additional sinking will make necessary the purchase of a hoist. In this connection it is expected that the top of the shaft will be concreted, and a higher headframe erected.

At the Custer Peak at a depth of 250 ft. oxidized material was found in lateral work. The company intends to put the shaft down to the zone of secondary enrichment. The company owns a large area, covering the vein for 3 miles.

The Elk Mountain Mining & Milling Co. intends to operate its cyanide plant and mine as far into the winter as possible. Lack of working capital has been a handicap. About \$5,000 would put the plant in condition for handling

three times the amount now milled. The plant has a crushing capacity of 300 tons daily, with a leaching tank capacity of only 100 tons. Hence the crushing department is forced to lie idle two-thirds of the time. Total cost of mining and milling is not far above \$1 per ton.

UTAH.

Milford.

Antelope-Star Mining Co. has a highly mineralized group of nine mining claims, located on the westerly slope of Bradshaw-Lincoln range, Beaver county. The camp is 21 miles northeast of Milford, and 8 miles east of Blackrock. The group extends from the mouth of a canyon to the crest of the range, and 2000 ft. or more laterally, embracing 200 acres on the mountain side. This area covers one main canyon, two minor gulches, and two intervening spurs or ridges between canyons. The camp overlooks the great Escalante valley, drained by Beaver river. In this valley water is readily supplied from springs, small lakes and shallow wells. The Antelope-Star holdings resulted from acquiring and consolidating several individual locations, on which were surface workings in ore. The group is in a section of limestone, flanked on the north by quartzite and on the south by an intrusion of granite. The exposed area of limestone, between the quartzite and granite, has an extent of $2\frac{1}{2}$ miles along the trend of the range. That part covered by the Antelope-Star group is characterized by fissures and fractures, clearly exposed by the erosion along the gulches. These fissures strike north-south, east-west, and northeast-southwest. There is a series of such fissures within an explored zone approximately 800 ft. wide and 1000 ft. in length. In some instances the fissure is vertical, and in others it dips 35° to 60° . In some places there is a smooth defined lime wall on one side, the vein material on the opposite side extending irregularly into the lime beds.

In most cases the fissure veins and fractures contain mineralized gangue. This consists of limestone in various forms, barite, silicified lime and chert, containing galena, lead carbonate, and oxides of iron and manganese. As a rule, the galena occurs in bunches, small lenses and nodules in the barite, or sulphate of barium; the lead carbonate occurs with the iron in the lime gangue. This kind of mineralization seems continuous, so far as drifts and winzes have been extended, and is especially strong where the fissures and fractures intersect. At many places high-grade ore is found, but an average assay of ore from the numerous workings shows around 7% lead, 1 to 5 ozs. silver and 10% iron. The workings extend from the surface to depths ranging from 10 to 50, 100 and 150 ft., showing galena in detached bunches in the barite, which apparently protected it from oxidation and leaching; in the adjacent lime gangue is usually an oxidized and partly leached material. There is every reason to anticipate the finding of solid and continuous bodies of lead-iron sulphide within these fissures at greater depth, or below the leached-out zone.

By sorting, a considerable tonnage of galena and cerussite of shipping grade is being taken from existing workings; and a much larger tonnage of milling ore has been developed. Consequently, the continuance of work may logically lead to the need of a mill to concentrate the low and medium grade ores. In nearly all the veins thus far opened the presence of a large amount of barite is noted. This is composed of 66% baryta, and 31% sulphur tri-oxide, often called heavy spar. It has a specific gravity of 4.3 to 4.8, which is much greater than that of lime and quartz. It so nearly approaches in weight some of the pyrite and carbonate ores as to make difficult its separation from them by gravity concentration. For this reason, it is probable that flotation machines will be installed in any milling plant that may be built.

Those who have studied the ore deposition here predict that deep workings will reveal the concentration of the ore in sulphide bodies and the disappearance of the barite from the vein matter. But the fact remains that much of the ore

available at 100 to 200 ft. or deeper is accompanied by this heavy spar, which will have to be reckoned with in milling.

The projecting ridge to the south of the main canyon is designated as South hill. At its south end, facing the valley, copper carbonate ore was found, assaying between 2 and 3%. Farther east on same ridge is a drift 135 ft. on one of the fissures, all in ore. A winze sunk here shows a dip south 45° . The ore consists of galena in barite and lead carbonate in lime. This drift, when extended farther, will connect with an incline being sunk on the same vein at a higher point, where 200 ft. depth will be gained.

A 75-ft. shaft has been sunk on another fissure, 100 ft. west of the tunnel; this work shows galena in silicified lime as a gangue, with no barite. This fissure lines up with mineralized croppings and a 65-ft. shaft 800 ft. southeast. Numerous other surface workings and shafts in ore are to be seen at other points on this hill, attesting to the existence of the series of fissures referred to. In the deeper exploratory work here the oxides of manganese appear to increase.

On the north side of the main canyon is East hill, Quartzite gulch separating it from the quartzite country to the north. In a similar manner, East hill is cut by numerous fissures and fractures, the same as is South hill, striking north-south, east-west and diagonally. The East tunnel, starting on the main canyon, has been driven 300 ft. north into East hill, following a fissure; and a crosscut has been driven east from it to a second fissure, giving 200 ft. depth on the latter. The ore thus opened contains galena in barite, lead carbonate and manganese in lime, all in the same veins. Surface workings at and near the top of this hill expose similar ore and serve to line up the croppings of fissures with the tunnel openings near the foot of the hill. An excavation on the north slope has exposed lime gangue and barite full of the ore previously described; and this appears to be on one of the diagonal veins. At another point near the crest is an adit level driven 100 ft. on a vein which is identified as the same one opened by a crosscut from a lower tunnel. This upper adit is in ore all the way, the barite and lime carrying galena and lead carbonate, being in evidence as in other places. A 55-ft. winze sunk from this adit follows the ore, showing no change at the bottom except possibly an increase in manganese, which occurs in segregated lenses in the vein, next to the galena. All these minor, exploratory workings are of interest as showing the preliminary steps in the transition from a prospect to a mine in its early stages.

To establish permanent workings on South hill a main vertical shaft will be sunk; and the present scheme of development on East hill is the driving of deep tunnels first, and a shaft later. It will be seen that there may be two centers of operation. The development is under direction of A. C. Nebeker, president and manager. Vitaly interested in the company as stockholders and directors are Woolley Brothers, Noble Warrum, W. N. Williams, C. N. Cheney, Aquila Nebeker, M. O. Hardy and others, all of Salt Lake.

WASHINGTON.

Curlew.

A trial shipment has been made by the Boston-New York group to the Northport smelter. The statement certified to the value of \$45.53 gross per ton, being 41 ozs. silver and $18\frac{1}{2}\%$ lead. The ore also carries 15 to 20% zinc. This is not given credit for, but as soon as the smelter is in shape to handle this metal the zinc contents will have a commercial value. The ore for the test was taken from surface. Here a fair deposit is disclosed. It is only a matter of getting under it when active production will commence. A tunnel, now in 50 ft., by running 20 ft. more will tap ore 200 ft. in depth. The tunnel will be run this winter. By spring the mine should be a regular shipper.

Loon Lake.

Loon Lake Copper has commenced sinking from the 200 to the 500 level. Levels will be established at each 100-ft. interval. The run will be 100 on the 300 level, but will be little if anything at the 400, as the vein is pitching toward

the shaft at a sharp angle. The descent is proceeding at the rate of 3 ft. a day. Three shifts are being worked in the shaft and two on ore. Two small stringers have been encountered in recent sinking. The east face in the stope on the 200 level is 200 ft. wide. It is almost solid chalcocite, and contains little quartz. About a car a week is being shipped which returns \$1400 to \$2000. Returns from the shipments are more than double the operating expense. While sinking is in progress a tunnel will be run to connect with the shaft at a depth of 85 ft. This is designed to improve the ventilation and expose a shoot pierced by the shaft 50 ft. deep. The new 50-hp. steam plant is running smoothly. Native copper has been exposed in a short sump from a drift at the 200 level.

Entiat.

Rex Development has opened a body of good ore but has been forced to shut down because cold weather froze the amalgamation plates. A cleanup of \$450 was made in the last 15 days of operation. The company will let a contract for 150 ft. in the lower tunnel to facilitate stoping. Operation of the mill will be resumed as soon as weather permits. The work is in charge of J. F. Hunt and Fred Knemeyer, Waterville.

Orient.

In reporting on the Butte & Washington, President Ward says a strike was made in the lower tunnel about 600 ft. from the portal. Until the present strike, no permanent ore body had been found. The ore body covers the entire face of the tunnel and has not been developed sufficiently to determine its length. Several shoots of high grade silver-lead have been encountered. The Great Northern railway passes along the Kettle river near the tunnel, thus furnishing easy transportation. The Kettle River Mining Company, three miles down the river, has a concentrating plant and I am hopeful that arrangements can be made with it to concentrate the ore of the Butte & Washington. At the Summit east of us a 1000-ft. tunnel is being run to strike the ore bodies at a depth of 1000 ft. The Summit has installed a compressor plant. It is making 2½ ft. a day in the tunnel.

WISCONSIN-ILLINOIS.

Deliveries of ores, for November 1st to 25th, inclusive, were reported by districts, as shown:

Districts.	Mineral Point.		
	Zinc. Lbs.	Lead. Lbs.	Pyrites. Lbs.
Benton	17,940,000	348,000
Miffin	5,084,000	60,000
Galena	4,740,000	80,000
Linden	3,504,000	760,000
Cuba City	3,272,000	2,244,000
Hazel Green	3,082,000
Platteville	2,958,000	156,000
Shullsburg	1,184,000
Dodgeville	912,000	78,000
Highland	894,000
Montfort	328,000
Potosi	260,000
Mineral Point	218,000	2,582,000
Totals	44,378,000	7,220,000	5,586,000

In addition to the above the New Jersey Zinc Co. delivered during November to its smelters at De Pue 64 cars of finished separator blende, 4,926,000 lbs. The gross recovery crude concentrate from all mines for the 25 days reported aggregated 37,000,000 lbs. Net high grade refinery ore to smelter direct and mine run ore to smelter 24,000,000 lbs. No reserve ore was left in the field at the close of last month and refiners were in need of crude ore to keep their plants running on full time. Prices made favorable gains during the month blende opening Nov. 1st, at \$70 per ton base of 60% zinc assay and going at \$98 per ton, with premium grades (refinery product) in advance of \$100 per ton. Lead ore advanced from \$80 per ton to \$90 and iron pyrites from \$1.50 to \$5.00 per ton to \$10.00 per ton.

Platteville.

New producers provided with complete rigs are coming in at several points in the field. The New Rose mine, at

Platteville, begins operations this week. A tunnel has been driven into the hillside from which the mill dirt will be fed to a hopper supplying the concentrator, all hoisting being eliminated. The lease has been extensively proven with drills and gives promise of developing into a good producer.

The Longhorn mine and mill, at New Diggings, property of the Wisconsin Zinc Co., turned out its first concentrates this week. The range cuts three leaseholds, has been proven by drills and two shafts are in ore. Electric power is used throughout. Three shifts schedule has been set for the mill crew which will turn from 300 to 400 tons of mill feed a day.

The surface equipment of the Federal mine, in the Galena district, has been dismantled, the machinery going to the Birkbeck mine and plant and the building material to the Champion property at New Diggings. A general warehouse and machine shop is being added to the Skinner separating plant.

Articles of incorporation have been filed for the New Rose Mining Co. Stockholders of the Big Bill Mining Co. at a recent meeting voted to continue with the work of prospecting. The M. & H. mine, one of the recent additions to newly developed mines is being unwatered and operations will be resumed underground. W. N. Smith, General Manager of the Vinegar Hill Zinc Co., has been appointed resident regent of the State Mining School, at Platteville.

Galena.

Fields Mining & Milling Co. and associate enterprises in the field have been made the targets of adverse public sentiment, the city authorities closing down the magnetic separating plant, presumably on account of sulphur fumes, over the exact source of which has arisen a controversy. A fine was assessed against the Galena Refining Co., the officers of which are connected with R. W. Hunt & Co. Insurance Exchange, Chicago.

L. V. Rice, general manager of the Fields Mining & Milling Co.'s mines, is authority for the statement, that the Crawhall mine, for many years one of the sturdiest zinc ore producers, has closed down and will be abandoned. The ore runs have been exhausted. In its time the Crawhall paid to the owner of the land nearly \$300,000, in royalties. During a 10-month period of 1912, the company paid \$300,000 in dividends. This was the high water mark attained by the Crawhall, which has been operating since with various but usually successful and profitable results. The J. M. Thompson mine, newly developed within the past year, is now operating steadily on extensions of the Crawhall range eastward and Rice is again challenging the field on mill diet hoisted, claiming that 800 tons of concentrator feed is hoisted daily. The plant is one of the best in the field and represents an investment of over \$60,000.

Shortage of cars is claimed in the field, but a careful investigation during the week reveals the fact that refining plants are in need of low grade ore for refining purposes which the mines have been unable to supply.

Benton.

Drilling operations of recent date for the Frontier Mining Co. is resulting successfully on the Calvert, Hird, Gt. Kin and Robson lands. The Calvert mine is in new runs of ore now being opened up which will restore the heavy output returned by this producer the first six months of this year. A new mill known as No. 2, on the Bull Moose, is operating with creditable results tapping the zinc ore formations found in the flint bed. Underground developments proceed at the Hird, under new plans recently adopted to insure the safety of working forces. The original plans brought the main hoisting shaft and working face into highly dangerous ground that demanded heavy timbering. Production of zinc concentrate is confidently expected before the close of the year. Drills are testing out the range on the Burr, one of the 1916 finds of the district. The regular 2% monthly dividend was paid to Frontier Mining Co.'s shareholders December 1st and an extra 10% dividend will be disbursed as a Christmas offering.

WYOMING.

Casper.

With 18 wells brought in and 50 drills operating in the Brenning Basin and Big Muddy fields, activity in the former field is increasing. The Douglas-Wyoming Co. expects to complete its first well soon and start drilling its second well. The Penn Petroleum Co. and several syndicates and close corporations are operating also in the Brenning Basin field. Joe Kinney has sold a half interest in his lease on 360 acres for \$100,000. The fourth well was brought in on this property last week, at a depth of 960 ft.

Exploration around Lander has practically been stopped for the winter. A hole that contractor Hyslip has down around 1000 ft. near the Hudson will probably be completed. The Ohio may also do more work at Sage creek if weather permits. However, most of the companies will let their rigs stand idle until spring.

CANADA.

BRITISH COLUMBIA.**Ymir.**

At the Yankee Girl a raise is being driven on the 28-ft. vein of milling ore which has been opened up at a depth of 710 ft. It was struck in the 3000-ft. tunnel driven to develop the mine at depth. It is not known if it is the same vein as that in the 710 levels or a new vein.

Diamond drilling is now being done at the Fog Horn on a gold vein at an approximate cost of \$4 per foot. The drill is being operated from the face of an 1100-ft. crosscut tunnel. This was driven at a cost of \$30 a foot to open up veins exposed in upper workings. It is estimated that the vein is about 900 ft. further in and that another 300 ft. of diamond drill work should locate it at the 1100 level.

Slocan.

J. C. Ryan, manager of the Soho mine, says that ore will be rawhided out before the close of winter. "Ore has been struck at 580 ft. We have a lead that is 5 ins. wide. It goes from 100 to 125 ozs. silver and 50 to 60% lead. Five or 6 ins. more of carbonates carry 50 ozs. silver and 23% lead. This ore has been broken into under the old works. The wagon road is completed to the upper mine and everything is in good condition for the winter."

An effort is now being made by Spokane interests to obtain control of the Alice S. mine owned by the British Columbia Silver Mines Co. A tunnel is being driven to tap the lead at a depth of 200 ft. below No. 2 tunnel. Here a body of high grade silver-lead was opened which gave assays of up to 2000 ozs. silver and over 45% lead.

Nelson.

About 50 ft. have been made in the Granite-Poorman tunnel which was started Nov. 5. The crosscut is from the Poorman shaft and will hit the Hardserabble vein at about 400 ft. in. Waste had to be cleaned out of the Poorman shaft, since it had not been worked for years. F. H. Skells is manager.

Cash surplus of the Utica Mines Co. is now \$50,000 as against \$37,000 a month ago. Since then 4 cars of ore have been shipped. The returns on the last car shipped prior to these four was about \$7000. Although the company is planning to drive a 1900-ft. crosscut tunnel to develop the mine at depth it has ample ore of shipping grade in the upper levels.

Trail.

An increase in the electrolytic plant of the Consolidated Mining Co. is being contemplated. The plant is now capable of producing 10 tons of 98% copper per day but it is intended to raise this to 20 tons. In speaking of the Trail smelter E. E. Hagen says: "It produces refined gold, silver, copper, lead, zinc, antimony, copper sulphate, lead pipe, sulphuric

acid, hydrofluosilicic acid and proposes entering the manufacturing field in other directions, such as white lead, zinc white, brass founding, nitric acid and probably chemical fertilizers. It handles an average of 42,000 tons of ore a month, of which 10,000 tons are silver-lead ores, 2000 zinc ores, and the balance copper-gold ores, mainly from Rosslund. The company is ever on the lookout for new mineral properties to develop. Its Sullivan mine is among the largest silver-lead-zinc deposits, the amount of proved ore being estimated at 3,500,000 tons. Reserves in its other properties aggregate about \$10,000,000. The gross value of its probable ore reserves is not far short of \$100,000,000 and it ranks third in value of ore reserves and assets among the mining companies of British Columbia."

ONTARIO.**Cobalt.**

At the National Mines, Ltd., lateral work has been started at about the 1100 level which is where the lower contact is encountered. The underlying Keewatin takes a rather steep dip to the north and a crosscut south will reach the contact with but a few hundred feet of work.

Five drills are now working on stoping and development at the Chambers-Ferland which is holding a small but steady production. The Nipissing No. 64 vein extension, which was cut at the 425 level is now being developed. The drift on this has been continued some distance, just above the contact and in the conglomerate. It is probable that later one or more raises will be put. The new boiler house has been completed and the new 10 by 12-in. hoist installed. The latter has a capacity for hoisting 1000 ft.

At the Davidson 50 men are employed at present. Development calls for the blocking out of the main ore body on the 100, 200 and 300 levels, and the sinking of the shaft to a depth of 500 in order to prove the vein at that depth. Arrangements are under way for the installation of a test mill, which it is believed will earn sufficient to pay its expenses. If results are satisfactory a large mill will probably be installed next spring. Drilling is being done on three levels. In the meantime sinking is proceeding on a promising vein on the south claim and lateral work will be started on the first level at this point in the near future.

Giroux Lake.

Active development has been started at the mines of the Hargraves Silver Mines Co. These properties have not been touched since 1913 prior to which time considerable underground work was done. In previous operations several promising looking veins were found but aside from the finding of several small pockets of ore no body of any importance was located.

Porcupine.

The plant of the Porcupine Premier has been enlarged and work resumed. Satisfactory development was done on the 100 level before the property was closed. A body of schist was found in a contact some distance to the south of the shaft. Ten feet of it showed gold values. With this as encouragement the management decided to sink to the 400 level before crosscutting.

McIntyre is erecting an aerial tramway across Pearl lake from the McIntyre Extension property to their mill. It will be in operation in about 6 weeks. It is being built because McIntyre has increased its hoisting across the lake. Development work has been concentrated across the lake for the past year. With the opening of the new tramway it puts at the disposal of McIntyre for milling operations a tonnage sufficient to run the mill for 6 months, with a daily capacity of 600 tons averaging \$11.

A new 200-ton crusher has recently been installed in the mill of the Porcupine Crown. At the mine the vein at the 800 level is 4 ft. wide, and good average assays obtained. At the 900 level the vein is better, being considerably wider and the grade a little higher. Drifting on the 900 has been done and the vein almost covers the entire width of the drift. Diamond drilling is under way from the 500 level to cut several parallel veins at 1000 ft. This vein showed a width of several feet of \$6 ore where cut at the 200 level.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores; (b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of Mining and Engineering World and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

I. GEOLOGY

GEOLOGY AND MINERALOGY.

Geology

Calkins, F. C.—*Molybdenite and Nickel Ore in San Diego County, California*. [Both ores are considered separately. The deposits to date are prospects, but worth future consideration].—U. S. G. S. Bull. 640-D; pp 10*.

Clapp, Charles H.—*Geology of the Nanaimo Map-Area*. [The area is on Vancouver island, British Columbia. Coal is the main product, though sand and gravel, clay and stone are also produced].—Canada Geol. Surv. Memoir 51; pp 135*.

de Schmid, Hugh S.—*Investigation of a Reported Discovery of Phosphate in Alberta*. [The Commission of Conservation, Canada, found phosphate rock near Banff, Alberta. The nature and geology of the deposits are here described in detail].—Canada Mines Branch; pp 50*.

Hinds, Henry.—*The Coal Resources of the Clintwood and Bucu Quadrangles, Virginia*. [A complete description of each bed in the area is given, with a general geologic description of the area as a whole].—Va. Geol. Surv. Bull. XII; pp 206*.

Hopkins, Oliver B.—*Structure of the Ficksburg-Jackson Area, Mississippi*. [The formation and its structure are discussed, with special reference to oil and gas deposits].—U. S. G. S. Bull. 641-D; pp 28.

Scott, Herbert K.—*Manganese Ores of Bulkowina*. [A paper read before the Iron and Steel Inst., London. Geology of the deposits, methods of mining, mining costs and selling prices and grades of the ore are among items considered].—E. & M. J. Nov. 25 1916; p 935; pp 3; 25c.

Stansfield, J.—*The Pleistocene and Recent Deposits of the Island of Montreal*. [The stratigraphy of the area is described in detail. Clay for red brick is the principal economic product produced].—Canada Geol. Surv. Memoir 73; pp 80*.

Watkins, Joel H.—*Railway Geological Department*. [An essay on the relation

of the economic geologists to the railway and what the railway companies are doing in this respect].—E. & M. J. Nov. 25 1916; p 931; pp 2½; 25c.

II. ORES AND METALS

(I) METALS AND ORES

Copper

Addicks, Lawrence.—*Possibilities in the Wet Treatment of Copper Concentrates*. [A paper read before the A. I. M. E. Curves are reproduced and the results of tests in roasting, leaching and chloridizing are dealt with].—Met. & Chem. Engg. Dec. 1 1916; p 628; pp 3*; 35c.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915*. Each state is reviewed separately by counties and by separate metals for the state as a whole].—Min. Res. U. S. I:14; pp 27.

Robins, Hallet R.—*Flotation at the Calaveras Copper—A Simple Flow-Sheet*. [Costs, transportation and the ore body are described, besides the flotation system. No table concentration is employed at all].—M. & S. P. Nov. 25 1916; p 769; pp 5*; 20c.

Vail, Richard H.—*Pinar Del Rio Copper Region, Cuba*. [Describes the deposits, their development to date and future possibilities. One good mine has already been opened].—E. & M. J. Nov. 25 1916; p 950; pp 2½; 25c.

Wilson, A. W. G.—*On the Possibility of Producing Refined Copper in Canada*. [Published by permission of the Mines Branch, Ottawa, Ont. The deposits, reserves and refining of copper in Canada are discussed].—Canadian Mg. Jnl. Nov. 15 1916; p 529; pp 6½; 35c.

—*Winona Copper-Leaching Test Plant*. [The Slater process is used. A 5-ton plant using hydrometallurgy and electrometallurgy is described and operating costs given].—E. & M. J. Nov. 25 1916; p 929; pp 1½; 25c.

Coal Fields and Mining

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine with respect to their production, activities, prof-

its and costs].—T. & N. O. Commission, Toronto; Report; pp 71*.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915*. [Each state is reviewed separately by counties and by separate metals for the state as a whole].—Min. Res. U. S. I:14; pp 27.

—*Gold Dredging in Yukon*. [Abstract of a paper published by the Minister of Interior Canada. The doings and equipment of operating companies in the district are reviewed].—Canadian Mg. Jnl. Nov. 15 1916; p 535; pp 10¾*; 35c.

Gold Milling, Metallurgy, Etc.

Key, A. Cooper.—*Miners' Phthisis Prevention*. [From a report of a committee investigating the disease on the Rand, South Africa].—E. & M. J. Nov. 18 1916; p 898; pp 2; 25c.

Production

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, profits and costs].—T. & N. O. Commission, Toronto; Report; pp 7*.

Frood, G. E. B.—*South African Mining in 1915*. [Deals entirely with coal mining, production, accidents, timbering, sanitation and stone dusting].—Coll'y Guard. Nov. 10 1916; p 905; pp 1; 35c.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915*. [Each state is reviewed separately by counties and by separate metals for the state as a whole].—Min. Res. U. S. 1:14; pp 27.

Hess, Frank L.—*Tungsten Production During First Six Months of 1916*. [A report of the U. S. G. S.].—Chem. Eng. & Mfg. Nov. 1916; p 292; pp 1; 30c.

McLeish, John.—*The Production of Iron and Steel in Canada During 1915*. [Production statistics and other information allied with the iron and steel trade are included].—Canada Mines Branch; Report 419; pp 48.

Wilson, A. W. G.—*On the Possibility of Producing Refined Copper in Canada*. [Published by permission of the Mines Branch, Ottawa, Ont. The deposits, reserves and refining of copper in Canada are discussed].—Canadian Mg. Jnl. Nov. 15 1916; p 529; pp 6½; 35c.

Mining Costs

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, profits and costs].—T. & N. O. Commission, Toronto; Report; pp 7*.

Scott, Herbert K.—*Manganese Ores of Bulkwina*. [A paper read before the Iron and Steel Inst., London. Geology

of the deposits, methods of mining, mining costs and selling prices and grades of the ore are among items considered].—E. & M. J. Nov. 25 1916; p 935; pp 3; 25c.

Accounts and Bookkeeping

Huac, A. J.—*Cost Accounting for the Clay Plant*. [Tables and forms for keeping costs of haulage teams, superintending and selling are included].—B. & C. Rec. Nov. 21 1916; p 991; pp 2*; 35c.

—*Cost Records of Drafting and Engineering*. [Forms and descriptions of the same for the distributing and keeping of costs on different jobs].—Engg. & Cont. Nov. 29 1916; p 472; pp 2*; 20c.

MILL AND MILLING

Crushing, Grinding, Etc.

Bradley, George.—*Crushing and Grinding*. [The use of various kinds of crushing and grinding machinery at present is discussed, as noted from results now being obtained in various mills of the world].—Jnl. Chem. Met. & Mg. Soc. of S. Afr. Sept. 1916; p 39; pp 2½; 50c.

Robins, Hallet R.—*Flotation at the Calaveras Copper—A Simple Flow-Sheet*. [Costs, transportation and the ore body are described, besides the flotation system. No table concentration is employed at all].—M. & S. P. Nov. 25 1916; p 769; pp 5*; 20c.

Flotation

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, profits and costs].—T. & N. O. Commission; Toronto; Report; pp 71*.

Lyon, D. A.; Ralston, O. C.; Laney, F. B.; Lewis, R. S.—*Bibliography of Recent Flotation Literature*. [A paper issued by the U. S. Bureau of Mines. The articles are those appearing in journals and periodicals and briefs of the article are given].—Chem. Eng. & Mfg. Nov. 1916; p 215; pp 3; 30c.

Ralston, O. C.; Lyon, D. A.—*The Present Status of the Ore Flotation Process*. [A paper read before the American Mg. Cong., in which a general review and description of the process is first given and followed by a review of its application to various types of ores].—Mg. World Nov. 25 1916; p 911; pp 1; 10c.

Robins, Hallet R.—*Flotation at the Calaveras Copper—A Simple Flow-Sheet*. [Costs, transportation and the ore body are described, besides the flotation system. No table concentration is employed at all].—M. & S. P. Nov. 25 1916; p 769; pp 5*; 20c.

Stander, Henricus J.—*Flotation*. [A paper read before the American Mg. Cong., being a general review of flotation, its scope and where it is now being found applicable].—Mg. World Nov. 25 1916; p 910; pp 1; 10c.

Cyaniding

Bradley, George.—*Crushing and Grinding*. [The use of various kinds of crushing and grinding machinery at present is discussed as noted from results now being obtained in various mills of the world].—Jnl. Chem. Met. & Mg. Soc. of S. Afr. Sept. 1916; p 39; pp 2½; 50c.

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, prof-

its and costs].—T. & N. O. Commission; Toronto; Report; pp 71*.

Daman, Arthur C.—*The Nevada Wonder Mill*. [Describes a 150-ton cyanide process, where 10 tons per man per day are handled. The distribution of electric power is contained in tables].—E. & M. J. Nov. 25 1916; p 927*; pp 2*; 25c.

Morgan, Harry J.; Ralston, Oliver C.—*Electrolytic Zinc-Dust*. [A paper read before the American Electrochem. Soc. on the electrolytical deposition of zinc from solution which would serve the cyanide process].—M. & S. P. Nov. 25 1916; p 779; pp 2; 20c.

White, H. A.—*The Manganese Silver Problem*. [Discussion of a paper by W. Neal on why low extraction only can be obtained in extracting silver in the presence of manganese].—Jnl. Chem. Met. & Mg. Soc. of S. Afr. Sept. 1916; p 39; pp 2½; 50c.

Mill and Smelter Costs

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, profits and costs].—T. & N. O. Commission; Toronto; Report; pp 71*.

Robins, Hallet R.—*Flotation at the Calaveras Copper—A Simple Flow-Sheet*. [Costs, transportation and the ore body are described, besides the flotation system. No table concentration is employed at all].—M. & S. P. Nov. 25 1916; p 769; pp 5*; 20c.

—*Winona Copper-Leaching Test Plant*. [The Slater process is used. A 5-ton plant using hydrometallurgy and electrometallurgy is described and operating costs are given].—E. & M. J. Nov. 25 1916; p 929; pp 1½; 25c.

Mill Miscellany

Cole, Arthur A.—*The Mining Industry in that Part of Northern Ontario Served by the T. & N. O. Railway*. [Covers the camps of Cobalt and Porcupine, with respect to their production, activities, profits and costs].—T. & N. O. Commission; Toronto; Report; pp 71*.

Robertson, J. A. T.—*An Engineer's Travels in Western China*. [A geographic review of the province of Szechuan, China, as related to the mining industries of the province, which are in their primitive stages still].—Mg. Mag. Nov. 1916; p 267; pp 13*; 50c.

Scobey, Fred C.—*The Flow of Water in Wood-Stage Pipe*. [Tables, curves and text on the practical theory and formulas used in connection with wood piping and a discussion of the adaptability of wood pipe].—U. S. Dept. of Agr. Bull. 376; pp 96*.

December	55.038	26.232
Year	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Conservatism once more prevails in copper. Excited buying has been replaced by normal trading. Price advances stimulated by speculative activity have given way to the stronger influence of the leading producers who desire to see copper's future prosperity unencumbered by over inflation of the value of the red metal. Since our last report quotations have been held at the top levels. Buying has been on a fair scale and well distributed among dealers and producers. Limitation of business for the second half of next year continues in force, although a number of important consumers are still sounding the market for this period. Buying of copper for first and second quarter delivery continues to appear regularly, indicating that many consumers who were uncovered did not partake in the frenzied buying of a few weeks ago. They have neither gained nor lost by deferring their covering operations, but they have at least assisted in stopping the establishment of a peak too lofty and insecure for even so strongly constructed a market situation as now exists.

The greatest sustaining factor in the copper situation is the wonderful expansion in real domestic consumption. That is production of copper products for home consumers. Export business has been tremendous, but it required an extensive domestic consumption to justify increasing production of copper above 150,000,000 lbs. a month. Wire mills are extremely busy. Many of them are refusing orders for delivery four months ahead. Copper wire has sold above 40 cts.

Transactions in copper since our last report are estimated to total 15,000,000 lbs. Compared with the business taken during November, which by the way, was the largest on record, this total may seem small, but it must be borne in mind the current buying is mainly from small consumers who do not buy well ahead. Many of the orders are only for carload lots so that the aggregate represents a considerable number of transactions. Spot electrolytic has sold at 35 cts. in tonnage lots with higher than 36 cts. paid for small lots. January electrolytic has also sold at 35 cts. in small lots. For first quarter delivery dealers continued to take orders at 34 1/2 cts. with second quarter business done at 33 1/2 cts. Few producers have accepted business for either of these deliveries asserting that they have no metal

for sale. Business for the third quarter has been done at 32 1/2 cts., while the nominal price for the fourth quarter is 31 1/2. January casting copper has sold at 34 cts., while for the second quarter one of the large producers has done business at 32 1/2 cts. Prime lake copper for prompt December and January delivery is quoted at 34 1/2 cts., with February and March delivery held at 34 cts., and second quarter at 33 1/2 cts.

The London market has advanced steadily, electrolytic going up £5 last week, while standard advanced £6 10s in spot and £3 in futures. The fortnightly statistics indicate an increase in stocks of copper abroad on November 30 as compared with November 15, the total visible increasing 2181 tons to 11,798 tons. Stocks of standard copper in England increased 2651 tons to 5478 tons, while stocks of fine copper in France increased 155 tons to 2120 tons. London advices state that the English government has contracted for the entire Australia copper output for all of 1917 paying £120 per ton for this metal. Full details of this transaction have not been received here as yet, but producers assert that such a deal would not indicate that England or the rest of the Allies could forego the purchase of American copper.

Quotations for copper per lb. at New York for the week ended December 6 were as follows:

(For First Quarter Delivery.)

	Lake.	Electrolytic.	Casting
Nov. 30.....	34 1/2 @ 34 3/4	34 1/2 @ 34 3/4	34 @ 34 1/4
Dec. 1.....	34 1/2 @ 34 3/4	34 1/2 @ 34 3/4	34 @ 34 1/4

Tin.—Developments both favorable and unfavorable have upset the tin market. Prices on nearby deliveries have gradually receded, while the strength of the limits from the east are alone supporting futures, as there has been no business to speak of. American deliveries were fair, amounting to 3165 tons, while the stocks and landing fell off to 2850 tons.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended December 6 were as follows:

Nov. 30.	New York		London.		Singapore

Lead.—An extreme scarcity of lead has resulted in the price jumping forward almost \$10 a ton in a week. Spot lead has sold at 7.60 cts. New York with producers now refusing to sell at 7.75 cts. New York. Lead for December delivery has sold at 7.50 cts. New York and is now ruling at 7.60 cts. New York. Independents have entirely withdrawn from the market on December deliveries. One large independent reports being entirely sold out for December, while the others are holding lead until the principal producer announces a change in its price. Selling for January delivery has also been large and some producers have even withdrawn from the market for that month, fearing overselling. Lead for January, February and March delivery was offered at 7.50 cts. New York this week. On Tuesday the A. S. & R. Co. advanced its price to 7.25 cts. The inaction on the part of the A. S. & R. Co. was mystifying. Few factors can understand why the principal interest adhered to the 7-ct. level when it was not selling at that price and was known that outside interests are receiving 50 to 60 points more for the metal. An interesting probability affecting the future lead situation came to the surface last week when word was received from London that a coal strike had started in Australia and that all manufacturing and mining operations were being affected. As England secures large quantities of lead from Australia a protracted coal strike would compel her to place orders in this country. While it is not expected that the strike will last very long some lead factors are preparing to take care of English trade if such a condition should arise. At London the market continues nominal, as all of the lead has been earmarked for government use.

Quotations for lead per lb. at New York and per ton at London for the week ended December 6 were as follows:

Lead Ore.—Prices were slightly up in the Missouri-Kansas-Oklahoma district during the week ended Dec. 2, and most ore went at \$91 per ton, though a fewer number of lots brought \$92.50. Sales made were a little larger than during the previous week and totaled 2,780,650 lbs. of concentrates valued at \$124,860. This brought the total for the year to 95,788,242 lbs. valued at \$3,983,834.

Zinc Ore.—The market has gotten to a steady basis and was practically unchanged from the previous week, with prices ranging from \$105 to \$90. Shipments made amounted to 18,416,410 lbs. of concentrates valued at \$901,865. The total for the year was placed at 653,758,147 lbs. valued at \$26,366,786.

Calamine.—Calamine at from \$62 to \$46 was about as during the previous week, though it is reported that some producers refused to sell at this figure. There were 892,935 lbs. of concentrates sold during the week which were valued at \$24,120, and this brought the total for the year to \$36,345,050 valued at \$1,082,079.

Spelter.—Business held to a good volume last week with prices rising steadily, but this week resellers appeared in the market and shaded prices, resulting in prospective buyers suspending negotiations in hopes of further price recessions. Producers, on the other hand, have not been very large sellers at the prevailing levels, insisting that they

will obtain better prices as the year draws to a close. With copper selling above 30 cts. it is remarked that brass makers will change their mixtures and use more spelter. It is also stated that the bugaboo of increased capacity has not materialized into increased production of spelter and that all around the market is shaping for 15-ct. metal. Spot prime western advanced to 13 3/4 cts. New York, but is now holding at 13 cts. Spot brass special is strong at 14 1/4 cts. St. Louis. Prime western for the first quarter sold up to 12 7/8 cts. and for the second quarter up to 12 1/8 cts., but these prices have since been shaded an eighth to a quarter cent. Spelter at London has been advancing, but is still under our parity, which restricts export business. Last week spelter at London advanced £1 10s in spot and .£3 in futures, with further advances this week.

Quotations for spelter per lb. at New York and per ton at London for the week ended December 6 were as follows:

MISCELLANEOUS METALS.

Quicksilver.—A drop of \$3.00 a flask took place in quicksilver last week, but on cables announcing an advance of £1 at London the price advanced back to \$80 per flask for spot virgin metal. Business has been dull and with supplies adequate some sellers felt that a lower price would stimulate buying. That the principal factors abroad did not favor a drop here was indicated by an advance on the other side.

Antimony.—The market has held steady in the absence of business, the strength being based on the scarcity of spot supplies. Chinese and Japanese brands are quoted at 14 1/2 cts. duty paid.

Platinum.—There has been no change in the situation. Jewelers have done the bulk of their holiday buying. The market remains steady at \$105 per ounce in retail lots, while in large lots sellers are asking from \$95 to \$100 per ounce.

Tungsten.—A strong trend towards higher levels has come with the cleaning up of spot tungsten supplies. Numerous sales have been made at \$18 per unit and for high grades sellers are now asking \$18.50 per unit. Buying has been very active with sales covering delivery over all of next year. Domestic consumers are now well covered, while a substantial foreign business has just been done.

Aluminum.—The situation remains as previously outlined, demand being fair with the market steady and unchanged at 63 to 64 cts. for spot virgin ingots and 58 to 60 cts. for No. 1 remelted. Sheet aluminum for 1917 contract is quoted at 40 cts., while prompt sheets are held at 75 to 80 cts.

Pig Iron.—Business has continued very large with the market strong at the top prices. Bessemer has sold in tremendous tonnages at \$35 valley furnace, and basic at \$30 valley furnaces. Foundry irons range from \$28 to \$30. Export buyers continue in the market for large tonnages of steel making grades.

Ferro Manganese.—A considerable business has been done in ferro manganese on first half contracts, but domestic makers have taken all of the orders, sales being made as low as \$160 delivered, with the market now holding at \$163 delivered. English makers continue to quote \$164 sea-board.

El Dorado Canyon—Mining, Milling and Development

W. A. SCOTT.

El Dorado canyon, in the southeastern part of Clark county, Nevada, has a length of about 11 miles, and drains easterly into the Colorado river. The mining district of that name encompasses the extensive region of igneous formations drained by the main canyon and secondary gulches and washes leading into it. In traversing this canyon from its terminus at the river to its headings near the divide there is an ascent of over 4000 ft. The postoffice and little town of Nelson, situated in the main canyon, 6 miles from its mouth, are 22 miles north of Searchlight, and 45 miles southeast of Las Vegas, both of which are railroad

Geology and Ore Occurrence.

In general features the El Dorado canyon region resembles those of Gold Road, Oatman and Boundary Cone, in Arizona, with respect to the prevalence of igneous and volcanic rocks of several classes. G. A. Duncan, manager of the Colorado-Nevada group of mines in El Dorado canyon, who has spent nine years in the district, has given out a statement relative to the formation and ore occurrence of the district, from which the following is taken:

"The district is near the northeastern edge of an extensive monzonite basin. The canyon is the result

MILL OF RAND MINING CO.

SURFACE WORKINGS ON WALL STREET VEIN.

points. Auto stages make regular trips from both those towns to El Dorado canyon. Nelson is on the route between Las Vegas, Nev., and Kingman, Ariz., and one of the auto stages makes three round trips per week between those towns, a distance of over 100 miles, crossing the Colorado by ferry, at the mouth of El Dorado canyon. Most of the supplies and equipment are hauled into the district from Searchlight. Travelers going into the country over the Los Angeles & Salt Lake railroad usually take an El Dorado canyon stage at Las Vegas, but often go out via Searchlight, which is the terminus of a Santa Fe branch.

of erosion along a profound fracture zone, into which intruded an andesite identical with the Comstock andesite. The dip of the old andesite intrusion is toward the north about 40°; and at various places along its course more recent porphyry dikes mark its hanging and foot wall contacts with the monzonite. Near the middle of this andesite filling of the fracture there intruded a strong porphyry dike, showing the same dip as that of the old andesite which it entered, and is exposed for several miles along the canyon floor. Along this more recent dike the ground movements seem to have taken place, the disturbances inviting erosion, with the obvious result that the canyon and

dike have a common course and position. The ground movements along this dike also caused a brecciated condition to a great depth along its walls, affording a channel for the collecting and passage of mineralized solutions, and making this dike now the one unfailing water course of this section. The ore so far found in this district is in, and along side of the main fracture,

MILL OF COLORADO-NEVADA MINING & MILLING CO.

and in veins departing from it. The outcrop of numerous veins parallel to this dike, and rather close to the old andesite filling of the great fracture, indicate workable ore bodies. Naturally, along so great a shear zone there are departing fractures leading off into adjacent country rock. Mineralizing agencies passed into these fractures, making veins of ore, which, while narrow in comparison to the main fracture vein, have shown some ores of high values."

Colorado-Nevada.

In going over a considerable area of the district, four or five centers of activity were observed along the principal canyon and its tributary gulches. One of the most conspicuous of these is the property of the Colo-

COLORADO RIVER FERRY, OPPOSITE EL DORADO CANYON.

orado-Nevada Mining & Milling Co., located on El Dorado canyon proper, $1\frac{1}{2}$ miles below Nelson. The company's holdings comprise the Flagstaff group, on the main fracture zone, and the White Star group covering one of the deflecting veins referred to in the foregoing statement. The ore bodies on the Flagstaff are within the porphyry dike which strikes easterly and

westerly along the course of the great fracture. This mineralized porphyry dike stands between andesite walls, and has a dip of about 45° toward the north. The porphyritic material, or vein matter, has undergone various degrees of alteration, making a gangue not entirely uniform in character. The ore consists of sulphides of iron, lead, zinc and copper, carrying gold and silver. The gold exists in free state but appears in fine particles. The silver occurs as argentite, as native silver and associated with galena. The vein bearing this class of ore has been mined to a width of 8 to 25 ft. Operations are carried on through an inclined shaft, which sinks 500 ft. on the dip of the vein, and levels on the vein both east and west from regular stations. The ore hoisted from the Flagstaff shaft, amounting to 60 tons per day, is treated in the company's mill by concentration and cyanidation. The ore is first reduced by a jaw crusher, then passed to a battery of ten 1250-lb. stamps, having 20-mesh screens. The pulp from the stamps is concentrated over two tables, a Wilfley and a Butchart, making a lead and iron concentrate carrying gold and silver. The mid-

PROSPECTING IN NEVADA WITH AUTO.

dlings and tailings from the tables are passed to a Dorr classifier and a tube mill, operating in closed circuit, and the cyanide treatment which follows consists of the Dorr system of continuous counter-current and decantation. During the last 4 months the mill operated on ore which assayed an average of \$14.49 per ton and made a recovery by concentration and cyanide treatment of \$13.62 per ton, or 94%. Water for mill work is bailed from the mine, and at times there is hardly a sufficient supply. Power is supplied by gasoline engines, in which California "tops" is used as fuel. The 100-hp. engine, by which the stamps and tube mill are operated, is a De Laverne, the four others, aggregating 150-hp., are the Fairbanks-Morse type. The company's White Star group has been considerably developed, but is not producing. The vein outcropping of the main fissure in the Flagstaff gave very low assays, and this is the case as to the secondary parallel veins. It is by sinking to some depth that the metals are found concentrated in regular ore bodies. In the Flagstaff mine, according to Manager Duncan, the gold and silver in the ore runs in the ratio of 30% gold and 70%

silver, in value; but as greater depth is gained the gold increases and is mostly associated with the sulphide of iron.

Techatticup Mine.

The Techatticup belongs to the Wharton estate and is being operated under option to Chas. L. Denison. It is situated on the mountain side, facing Techatticup wash, a branch of the main canyon, and is about a mile north of the Colorado-Nevada. The Techatticup vein runs nearly parallel to the main fracture vein herein described and is considered one of the offshoots therefrom. This is a comparatively narrow vein, in andesite, and has a dip varying from 20 to 80° to the north. The width of ore ranges from a mere seam to 6 ft. The gangue is composed of calcite and quartz, carrying gold and silver in sulphides of iron, lead, zinc and copper, assaying about \$20. Besides the principal vein, striking east-west, there is a branch vein coming into it from the southeast, called the Savage. This branch vein is likewise a fissure in the andesite and other characteristics are the same as those of the Techatticup vein. In the latter vein 90% of the value is in gold, the iron running 5%, zinc 2%, lead 2% and copper 1%. Ore in the Savage vein runs high in silver, much of which occurs as a chloride. In both veins the ore exists in shoots and other bodies, not continuous. Material between such shoots is mineralized but much of it is too low grade to be mined profitably. The 600-ft. inclined shaft was sunk close to the junction of the Techatticup and Savage veins, drifts therefrom extending into both. In general, the inclination of the shaft follows the dip of the vein, but in places where the vein flattens out considerably the shaft is some distance off the vein in the foot wall. There are five working levels, the longest drift east of the shaft being 600 ft. and the farthest west being 400 ft. A crosscut tunnel runs in 300 ft. to the shaft, connecting with it 150 ft. below the collar. This crosscut is on a level with the crusher floor and all ore is hauled out that way. Hoist and compressor are operated by gasoline engines, using "tops," or 40 to 44 gravity gas oil. Other shafts have been sunk on the property for development purposes. A cyanidation plant on the property treats 50 tons of ore per day. The ore is reduced to 4 mesh by a jaw crusher and two sets of rolls. At that size it enters a 5 by 22-ft. tube mill, using flint pebbles, by which it is so pulverized that 80% of it will pass 200 mesh. The cyanide solution is introduced in the tube mill. In passing this pulp to a Dorr classifier, the coarser sand is returned to the tube mill. The slimes pass to Dorr agitators and thickeners, carrying out the system of continuous counter-current and decantation leaching. In this work it is stated that an extraction of 90% is made. R. T. Walker is general superintendent; mine foreman, Frank Hoin; mill men, Roy Leach and G. M. Cotherton.

Wharton Estate.

This property is in control of the Girard Trust Co. as trustee, Philadelphia, represented in this district by

G. S. Borden. It has 22 patented claims in this locality, not including the Techatticup group. They are located in various parts of the district. All are idle excepting in two or three places where ground has been leased. The most noteworthy of all is the Wall Street group, on El Dorado canyon, a mile above Nelson. In earlier years gold and silver ore of the value of over \$1,000,000 was mined and milled. This was taken from a vein 10 to 15 ft. wide, striking east-west, with a dip of 40° south. The ore was mined to a depth of 80 ft. and a length of about 100. Much of the ore is said to have milled \$250, and was hauled to a stamp mill on the river, in which the gold and silver was recovered by amalgamation. Records show that the ore contained 1 oz. gold to 3 ozs. silver. There is now some water in the bottom of the workings. The property was located in 1871 and came into possession of Wharton in 1892. While the Wall Street has been idle during the last 16 years, it has an interesting history and is today a show place in the district. In that locality some of the richest ore thus far found in the district has been uncovered by surface cuts and shallow shafts.

The Rand.

Rand Mining Co. owns 32 claims formerly controlled by the Black Hawk Mining Co. Under the management of Robert Dunbar, Pittsburgh, operations were resumed in February, 1916, with L. C. Campbell as superintendent. The location is on the south side of Copper canyon, on the Searchlight road, about 2 miles west of the Wall Street. The holdings cover 1½ miles on the strike of an east-west fissure vein in monzonite-porphry. The vein has a varying dip to the north. It has been opened by a 500-ft. inclined shaft, following approximately the general dip of the vein. Water came in at 400 ft. and workings below that level are now submerged. A big tonnage of oxidized ore was formerly mined in stopes near the surface. The sulphides were found at and below the 100-ft. level. Ore now being stoped above the 300 level occurs in defined lenses, the gangue being quartz, spar and altered rock. The gold is largely free and amalgamable, the sulphides being those of iron, lead, zinc and antimony. The lead is accompanied by silver. An electric duplex plunger pump, stationed at the 400-ft. level, is used for lifting water to a tank on the surface for mill work. In the shaft house is a gasoline engine for operating a skip in the incline and an air compressor. The Venus shaft, 1200 ft. west of main shaft, contains a supply of water and this is considered in a separate basin. An electric pump is stationed at the 200 level of the Venus whereby water is furnished for domestic and other uses at the camp. Electric power is produced by a Westinghouse generator, driven by a gasoline engine in the mill. This is used for lighting and for pumping operations. The milling plant, consisting of 10 stamps, amalgamating plates and two Deister tables, is operating with one shift, but this is to be increased to two shifts. The pulp from the plates runs into a classifier,

the heavy material passing to a sand table and the lighter to a slimer, making lead and zinc concentrates of different grades. The tailings are being impounded. This camp is 2000 ft. higher than that of the Techatticup and is 800 ft. higher than the Wall Street.

This is one of active centers previously referred to. The Quaker City, on a parallel vein lying north of the Rand, belongs to the Wharton estate, and south of the Rand is the Enterprise group, having a parallel vein formerly opened by an adit level, and on which development is being undertaken by present owners, including E. P. Jeanes, C. E. L. Gresh, H. H. Johnson and Leonard & Co. Existing workings show a fair grade of ore. Other holdings in this locality are on strong veins that will probably justify development. The Occidental-El Dorado, half way between the Rand and Wall Street, is well developed by tunnels and shafts and equipped with hoist, air-compressor and cyanide plant. It has been idle several years, but it is possible that operations may be resumed.

Carnation Lode.

This group of 20 claims, lying north and west of the Wall Street, belongs to W. H. Evans and is under a 5-year lease to A. Welk, C. A. Spencer and W. H. Kirchner. These men, who were formerly in Good Spring district, are exploring and developing, and recently struck a 5-ft. face of ore in a 20-ft. shaft. Other veins on the group have been opened by 60 and 40-ft. shafts, exposing pay ore. Assays of the rich ore in the 20-ft. shaft, according to the assay certificates, showed up as follows: Sample No. 1, 3.85 ozs. gold and 32.56 ozs. silver; No. 2, gold, 127.61 ozs., silver, 1246.9 ozs. No. 3, in three parts, gave gold, 12.08 ozs., 6.8 ozs., 3.8 ozs., respectively, and gave in silver 106.12 ozs., 71.6 ozs. and 28.8 ozs., respectively. All this ore consisted of sulphides, the gold being apparently free. Ore taken from other shallow workings assayed \$8 to \$12 per ton. Specimens taken from a high grade streak in the 20-ft. shaft ran over \$3000 per ton in gold and silver. This leasing firm announces that a small mill of 25 to 50 tons capacity will be erected this fall for amalgamation and concentration.

These rich strikes on ground adjacent to the old Wall Street are making this another active center in the district. The lessees named have let a number of sub-leases, one of these being to Jas. German, M. E. Fisher and Chas. Herman, who have taken over the Lombard Street claim for 5 years. Their development has exposed pay ore 18 ins. wide in a 5-ft. vein.

About 1500 ft. farther down the canyon, apparently on the same mineral belt, is the El Dorado-Empire, in the hands of C. E. L. Gresh and associates. Ore of good grade has been found in a 70-ft. shaft, over which they have a gasoline hoist.

Clark M. Alvord has two groups of claims partly developed. One is the Skylark, located between the Techatticup and the Colorado-Nevada. He has an east-west vein in andesite, on which some ore has been blocked out. The ore is similar to that of the two

mines in that locality. A small shipment of sorted ore sampled \$55 per ton. His other group is the San Juan, extending to both sides of El Dorado canyon, half a mile below Nelson. Development by adit levels exposed sulphide ore, assaying \$4 gold, 7 ozs. silver, 18% zinc and 17% lead. There are four parallel veins. A crosscut is being driven to cut the San Juan vein at a depth of 400 ft.

J. B. Caldwell purchased the Little Eohippus, located one-half mile east of Colorado-Nevada, of J. E. Babcock. Surface work has disclosed some ore on an east-west dike of porphyry. He expects to install a gasoline hoist and air-compressor and develop the property.

Allcock & Wells, Nelson, have some development on the Champion group, located on January wash. This wash enters the main canyon in the vicinity of the Colorado-Nevada. It is claimed there are four veins on the group, opened to some extent by adit levels and winzes. The ore contains gold and silver in sulphides of iron, lead and zinc.

Knob hill, at the head of January wash, is the location of a number of properties, some of which are well developed. Included in these are the El Dorado-Star, Empire, Ben-Ezra and Rich Hill. Among other properties farther east are the Capital, the Wallace and Astor-El Dorado. The Knob hill region was not visited.

New Aluminum Smelting Plant.

The Aluminum Ore Co., a subsidiary of the Aluminum Co. of America, Pittsburgh, has bought a tract of 200 acres or more at Sollers Point, near Sparrows Point, Md., on which it proposes to build a plant for refining bauxite, from which aluminum is extracted. The company has maintained at East St. Louis, Ill., for some years a similar plant, obtaining the bauxite from Arkansas, Georgia and Alabama. The capacity of the new plant at Sollers Point will be much smaller than that of the plant at East St. Louis, but it will be enlarged when the demands of the company make this imperative. The new plant will be built by the engineering organization of the Aluminum Co. of America, which is fully equipped to do the work. C. B. Fox, general superintendent of the East St. Louis plant, will be in regular consultation with the company's engineers in Pittsburgh during the progress of the construction work. The Sollers Point plant is expected to cost somewhat in excess of \$1,000,000 and to be in operation early in 1918. The Aluminum Co. of America is the largest manufacturer of pure aluminum in the world, its principal plants being located at Merryville, Tenn.; Baden, N. C.; New Kensington, Pa.; East St. Louis, Ill.; Niagara Falls and Messina, N. Y., and at Shawinigan Falls, Quebec. The last named plant is operated by the Northern Aluminum Co. of Canada, an identified interest of the Aluminum Co. of America. The company has several smaller plants at other locations.

Outlines for the Determination of Zinc

R. FRANKLIN HEATH.

In preparing the sample it is advisable that it be of uniform fineness of at least 100 mesh. Many chemist-assayers consider 60 to 80 mesh proper, but time saved in putting the zinc in solution will make up for careful work. In place of tenth-normal solutions as named in the volumetric outlines, any standard strength solution can be used with satisfaction.

Gravimetric Methods.

Weigh out 1 gram of the sample and put it in a casserole. Add 10 cc. HCl and 5 cc. H₂O, boil until decomposed, evaporate to dryness but do not bake, take up with 10 cc. HCl and bring to a boil, then filter and wash residue with boiling H₂O. The filtrate contains the zinc. Cool the solution and pass H₂S gas through it until precipitation is complete. Then filter and wash the precipitate with H₂S water. The filtrate and washings contain zinc. Bring the filtrate to a boil and boil until all H₂S gas is removed. Add 10 cc. of saturated solution of sodium carbonate and bring it to a boil for 1 minute, filter through an ashless filter and wash the precipitate with boiling H₂O. Then dry, ignite and weigh the precipitate, which is zinc oxide. The zinc factor is 0.8034.

Another method is as follows: Weigh out 1 gram of the sample and add 5 grams of potassium chlorate and 10 cc. HNO₃. Bring it to a gentle boil and evaporate to dryness, take up in 10 cc. H₂O and again evaporate to dryness. Next add 15 cc. HCl, bring to a boil, dilute with 10 cc. of acetic acid, boil, filter, and wash the precipitate with hot water. The filtrate and washings contain the zinc. Add 10 cc. of saturated solution of NH₄Cl, bring to near boiling and at the same time pass H₂S gas through the solution until precipitation is complete. Filter through an ashless filter, dry, ignite and weigh the precipitate as zinc oxide. The zinc is first precipitated as a sulphide. Test the filtrate for any remaining zinc by adding a solution of sodium phosphate or potassium ferrocyanide. In either case if any zinc remains it will give a white precipitate, in which case add more ammonium chloride and pass more H₂S gas through it until all zinc is down. The results of gravimetric analysis are always somewhat higher than those of volumetric methods.

Volumetric Methods.

Weigh out 0.5 grams of the ore, add 3 cc. HCl and 1 cc. HNO₃. Let it simmer until the ore is decomposed. Dilute with water, about 22 cc., filter and wash the insoluble matter with hot water. The filtrate and washings contain the zinc, together with other metals. Add 3 grams of aluminum foil, heat to a boil and the iron, lead, copper and cadmium will deposit on the foil. Filter and wash with water. The filtrate contains

zinc. Add 5 cc. of ammonium chloride solution and acidify with HCl if not distinctly acid in reaction. Dilute to 100 cc. exactly, shake, remove 10 cc. with a pipette and titrate this amount with tenth-normal solution of potassium ferrocyanide using a dilute solution of uranium nitrate or acetate, or ammonium molybdate as an indicator.

The calculations are:

(cc. titrated):(to amount diluted)::(factor times cc. used): X.

Weight used: X::100:X₂. Here X₂ equals the percentage of zinc.

Many chemists prefer to titrate the whole amount of metallic solution, but if the zinc contents is high a large amount of potassium ferrocyanide will be required to secure the end reaction.

Sodium Sulphide Method.

Weigh out 0.5 gram of the sample in a small casserole, add 5 cc. HCl and 3 cc. HNO₃. Heat until decomposed and then add 5 cc. of hydrogen peroxide. Bring to a boil and add 3 grams of test lead or aluminum foil. Let it stand for 3 minutes, then filter, wash with dilute ammonia water, cool and titrate with tenth-normal or standard solution of sodium sulphide, using a solution of ferric oxide (1 gram of ferric oxide dissolved in 10 cc. HCl and diluted to 100 cc.) as an inside indicator. The end reaction is reached when the last drops turn the solution to a dark brown or black, caused by the formation of ferric sulphide.

Ores Containing Silica.

Weigh out a 1-gram sample and place it in a casserole. Add 5 cc. HCl and 3 cc. HNO₃, evaporate to dryness, take up in 10 cc. HCl, bring to a boil, add 3 cc. HNO₃, boil 1 minute, dilute to 25 cc. with water, filter through an ashless filter, wash the insoluble SiO₂ with hot water, dry, ignite and weigh as SiO₂. Take the filtrate and washings from the silica, reduce the copper present with test lead or aluminum foil, and proceed as given in any of the above outlines.

Electrolytic Methods.

For Spelter, Concentrates and Alloys—Weigh out 1 gram of the sample into a casserole, add 10 cc. HCl and 5 grams of potassium chlorate with a little water. Bring the whole to a boil, evaporate to dryness and cool. Then take up in 22 cc. of dilute HCl, add 10 cc. of cold water and pass H₂S gas through it until precipitation is complete. The gas precipitates Cu, Cd, As, Sn, Pb, Sb and Au. Filter this and wash the sulphides and other matter with H₂S water. The filtrate and washings contain the zinc. Evaporate to 20 cc. and add 5 cc. of ammonium chloride solution.

Make this neutral with ammonia water. If iron is precipitated filter, and wash the precipitate with water. Take the filtrate and washings and make them acid with lactic acid. Add 1 gram of ammonium sulphate and 3 grams of ammonium lactate. Dilute to 100 cc. with luke warm water and proceed with the electrolysis. For the cathode (negative electrode) use a platinum, gold or nickel dish of about 200 cc. capacity, about 8 cm. in diameter and 4.5 cm. in depth. For the anode (positive electrode) use a heavy piece of platinum or gold foil, about 4.2 cm. in diameter fastened to an upright (of same material as anode) in the center of the dish. Any of the various stands and supports can be used, to hold the dish and anode in position. Pour the solution into the dish and start electrolysis with a current density of 0.5 amperes and 5 volts and electrolyze until the solution shows no indications of zinc, which usually requires about 1½ to 2 hours. By agitation the process may be somewhat shortened. When the zinc is completely removed from the solution first wash with cold water, then hot boiling water and dry in a desiccator. Then weigh and determine the percentage of zinc. In place of a dish as the cathode some prefer a plain cylinder of platinum, gold or nickel about 5 cm. long and 1.5 cm. in diameter, and for an anode a plain heavy platinum wire in the form of a flat spiral about 2.5 cm. in diameter and long enough to make connection with the support. With the cathode and anode as described above use a plain beaker to electrolyze the solution in. For current wet cells are more adaptable than dry, one Grove cell being able to generate sufficient current to electrolyze two solutions at one time. Where alternating current is available use a step-down transformer and rectifier, connected in series with one or more regulator-rheostats. Such an outlay will soon pay for itself where any great number of analyses are made in a day.

Another method for the determination of zinc is based on the fact that the metal is separated by electrolysis from a double salt of zinc ammonium oxalate and zinc potassium oxalate. Weigh out 1 gram of the sample. Add 10 cc. HNO₃, bring to a boil, evaporate, take up in 5 cc. HNO₃ and again evaporate to dryness, dry, cool, take up in 15 cc. dilute H₂SO₄, bring to a boil, dilute to 35 cc. and pass H₂S gas through it until all sulphides are precipitated. Then filter and wash the sulphides with hot water. The filtrate and washings contain the zinc. Evaporate to 10 cc., make neutral with ammonia water, add 2 grams of potassium oxalate to the neutral solution of zinc and bring to a boil. Next add 3 grams of ammonium oxalate in 10 cc. of warm water to the zinc solution and bring the precipitate into solution by agitation and heat. Electrolyze as given in preceding directions. When the solution has been electrolyzed for about 5 minutes make it acid with tartaric or oxalic acid and keep the solution acid until complete precipitation. Do not add an excess of acid to start but add gradually.

In the determination of zinc by electrolysis the result is always somewhat higher than the volumetric methods, but by careful work will check on either volumetric or gravimetric methods, besides having the advantage of making a large number of analyses possible per day.

Davis-Daly Co.'s New Hoist.

A hoist which has some very interesting features is now being installed by the Davis-Daly Copper Co., Butte, Mont. This is a Nordberg first-motion unit, having 22-in. duplex steam cylinders with a common stroke of 48 ins. The hoist has two clutched drums, 6 ft. in diameter, 56-in. face. Both drums are equipped with Nordberg axial plate clutches and parallel motion post brakes. The hoist is designed to handle the following loads:

Rock, 7000 lbs.; skip and cage, 8300 lbs.; rope, 8000 lbs.; total rope pull, 23,300 lbs.; depth, 4000 ft.; hoisting speed, 2000 ft.

The engines are of the Corliss type and are equipped with the Nordberg 4-gear reverse. Features pertaining particularly to this hoist are the use of oil for operating the brakes and clutches and the installation of shifting valves in the cylinder heads. To operate the brakes and clutches by steam requires a considerable percentage of the total steam consumption of the hoist, and therefore makes a very wasteful arrangement from the standpoint of steam economy. It was, therefore, decided to operate the brakes and clutches by oil furnished by a weighted accumulator. The oil supply is obtained from a triplex plunger pump which is operated from the lay-shaft driving the valve gear, and an auxiliary motor-driven oil pump is also furnished.

The shifting valves referred to above are relief valves, which are placed in the cylinder heads so that should the engine ever expand below atmosphere these valves will open, thus admitting atmospheric air. Where the loads to be hoisted are of considerable proportions and the depth of wind great, the engine at the end of the run is very apt to draw a loop in the indicator card thus meaning a loss of power. It is for the purpose of eliminating this bad feature that the shifting valves were installed.

The hoist is equipped with a Lilly safety stop to prevent over-wind, over-speeding, etc.

Drag line excavators are in rapidly increasing demand for working placer ground or in open-cut mining, as well as in excavating for surface plant construction, building up fills for mill and smelter sites, handling tailings piles, etc.

Natural abrasives produced in the United States include the following: Millstones, oilstones, diatomaceous earth, tripoli, pumice, grindstones and scythestones, garnet, pulpstones, emery and corundum.

Dredging for Minerals: Past and Present

F. W. PAYNE.*

Probably the first mineral dredges were those put to work in New Zealand in the late eighties. At that time a small fleet of dredges was built for the Shot-over and Clutha rivers. The first dredge was, I believe, one built by a Dunedin company to work on the Clutha river, near the township of Alexandra South. Not meeting with immediate success, the dredge was moved some 30 miles down the river to just above Roxburgh, where it had a long and checkered career. This dredge was originally equipped with two bucket ladders, one on each side. This arrangement was a failure owing to one line of buckets getting into heavy work and then the other causing the dredge to rock sideways to such an extent as to render satisfactory cleaning up of the river bottom impossible. The pioneer builders were, however, men of resource and prompt action, and they cut the dredge down the center and formed two separate pontoons, between which they then set one of their bucket ladders to work. This plucky old-time ship had practically the whole of the river to choose from and, as often happens in such cases, she left the richest portions for later ventures.

Before the advent of the dredges, the banks of the Clutha river had been in many places worked for gold to a line as near as possible to water level, and these old workings with in some cases long water races leading to them, still stand as monuments of what a few men can do when lured on by the stimulus of gold. The location of the early-time dredges was generally determined by the amount of success these old miners had achieved in the river banks or beaches.

The first small fleet of dredges, already alluded to as commencing work in the late eighties, were not very successful, and on the companies going into liquidation the dredges were bought up for trifling sums by small private parties. These men were many of them sailors, and worked the dredges themselves. As the working expenses were low and the only wages to be paid were to themselves, they could afford to work and wait, and their rewards came.

The first dredging ventures were confined to the river beds, and when the dredges began to trace the gold leading into the banks the problem arose as to the disposal of the tailings, and the first tailings elevators were installed. As river flats and high banks were dredged into, these elevators quickly developed into a very important feature of the gold dredges. A dredging venture that failed to strike gold during the first few weeks of its working had small chance of success, as few had sufficient capital behind them to effect more than a start. No doubt there are still large tracts of land in New Zealand that will some day pay

handsomely for dredging. The dredges that ultimately work these deposits will of course be far in advance of the machines that were built in the nineties. Prospecting has now become more easy to carry out and has achieved a reliability unheard of in the boom time, and it is safe to say that never again will dredges be built and put to work before the value of the ground has been thoroughly tested.

Probably the chief center of Australian dredging interest at the present time is the Federated Malay States and Siam. Tin dredging has achieved a great success in these countries and under conditions that, from a dredging engineer's point of view, are by no means ideal. The results, however, are the only test worth considering. Dredging in Malay had first, as elsewhere, to overcome prejudice, and also an opinion honestly held by many mining men that it was not feasible to dredge where a limestone bottom existed; especially as the limestone is sometimes in pinnacles, which no doubt is not an ideal condition for bucket dredging.

The first dredge of the Malayan Tin Dredges, Ltd., the pioneer dredge of Malay, was started with serious misgivings. A. C. Perkins, consulting engineer, had boldly declared for bucket dredging in this company's area, and remained long enough in Malay after supervising the erection of the first dredge, to see his optimistic views justified. This dredge has now been followed by three others of larger and improved type, the company now having four dredges at work.

Further up the Kinta Valley the Ipoh Co. has a dredge at work which, although hampered financially at the start, has now cleared itself and is paying dividends. The pessimists were loud in their condemnation of this property, and it required a bold man to hold hopeful views concerning it, but the results have vindicated the faith of the few. Almost adjoining the Malayan company's ground on the opposite side of the railway line is the Kinta Valley Co.'s area. This ground is practically the same as the Malayan, and as exhaustive boring shows highly satisfactory values the success of this venture may be taken as assured.

A most important condition to a successful result in a dredging venture is the class of dredge that is put to work on the claim. A peculiarity of bucket dredging is that variations in design of machinery are required for almost every claim, and thus a dredge cannot be ordered like a reaper and binder or a motor car. Every detail has to be carefully thought out and designed with a view to the particular requirements of the area concerned. Engineers cannot increase the mineral contents of the ground, but they can reduce the working expenses, which effects the same result. The aim of the designer should be to secure the great-

*In *Mining and Engineering Review*, Melbourne.

est return at the least expense, and whether this is effected by large, expensive dredges or smaller and less imposing machines, the result is equally satisfactory from the point of view of the shareholder, which is the only point of view that has a right to be considered. One important feature of dredge design is simplicity. An old client of the writer's who was largely interested in New Zealand dredging used to say that he wanted a dredge with one wheel. This, although impossible, is perhaps as good an ideal as any for the dredge designers to aim for. When complications are introduced he must be satisfied that such complications are justified by reduced expense somewhere—that they will reduce labor or facilitate operation in such a way as to effect a sensible saving of time or fuel or effect a better saving of the mineral.

Losses in recovery should be combated strongly. It should not be overlooked that every cubic yard of material that is lifted has cost the company so much actual cash, and to let mineral go overboard again is equivalent to the action of a shopkeeper who, when emptying the till, would throw away the coppers on account of the trouble incurred in counting them. The dredge designer has, therefore, two requirements to study: (1) save every possible cent in working expenses; (2) save every possible grain of mineral that comes on board. There is still room for the engineer to exercise his ability and inventive faculties in bringing these two questions nearer to the irreducible minimum. The second problem is definite, as when all the mineral is recovered no more can be done. The first will always be comparative, as with whatever power is used and whatever machinery employed it will always cost something to run. In practice both questions offer good margins for improved methods.

The future of dredging is largely with the engineers. Every sensible advance made by the engineer in the directions indicated brings fresh territory into the range of paying propositions. The opinion is often expressed that the palmy days of dredging are over. This is no doubt true if what is meant are the days when capital could be secured to dredge any likely looking piece of ground without prospecting it, but in the opinion of those in the best position to be able to judge, real legitimate dredging enterprise is practically only commencing.

Asbestos in Arizona.—Up to the present time Canada was the only locality in America where long-fibered asbestos was obtained. While Wyoming produces asbestos, this material is of the serpentine type and is short-fibered. Lately large deposits of the long-fibered type of asbestos were discovered in Arizona, the largest deposits being in the Sierra Ancha and at Ash creek. The asbestos of Arizona is chrysotile asbestos and is found in lime and diabase. Its nature makes it especially useful for the manufacture of fabrics. The high-grade material is at least 50% of the total material mined and is the only material that is being shipped, due to the high freight.

The Tenth Chicago Cement Show.

The 10th Chicago Cement Show will be held in the Coliseum, Wednesday, Feb. 7, to Thursday, Feb. 15, 1917, inclusive. This is the ninth successive cement show that has been held in Chicago, and will be housed under one roof, making necessary the use of the balcony as well as the main floor and annex of the Coliseum.

The unusual number of manufacturers and producers of building materials and concreting equipment who have already made application for space at the Tenth Chicago Cement Show, makes it highly probable that builders who attend the 1917 show will find an even wider range of products and equipment than was presented at the ninth show. In addition to the standard machines which will be displayed, a number of the better of the new machines and devices which have been developed since the last show will be on exhibition.

Every possible effort is being made by the show management to conserve the available space in order to accommodate as large a number of applicants as possible. Exhibitors have been requested to make application for the minimum amount of space in which their exhibits can be installed and the arrangement which eliminates the drawing for space and permits the management to make direct assignments should do much towards saving space and making the show truly representative of the industry.

The joint exhibit of cement companies at the tenth show will in all probability excell the last exhibit in real educational value. Cement manufacturers have contributed more money for the exhibit and the plans to show concrete products in the making should make this exhibit worthy of careful study.

Production of Scheelite in New Zealand

Scheelite, according to Consul General Alfred A. Winslow, Auckland, is found in several sections of New Zealand in the neighborhood of the gold mines both in the North and South Island, and has of late been quite extensively mined. The output has increased from 58 long tons, valued at \$20,746, in 1909 to 130 tons, valued at \$64,953, in 1912 and to 194 tons, valued at \$135,211, in 1915.

Since September, 1915, the British government has requisitioned all supplies of scheelite and other ore containing tungstic acid, and from that date all exports to other markets have been prohibited. The price fixed by the imperial government was £2 15s (\$13.38) per unit (a unit being 1% of tungstic acid in the sample) delivered at London or Liverpool, the scheelite concentrate to contain not less than 65% (65 units of tungstic acid).

It was reported in the latter part of 1915 that a large body of scheelite was located in the eastern part of the North Island in the Hawke's Bay district.

The Discovery of "Kimberlite" in Brazil

A. L. M. GOTTSCHALK.*

Some correspondence from the United States has reached this office concerning my report of August 8 on "The Diamond Fields of Brazil," in which mention was made of the presence in this country of the eruptive masses commonly known as "pipes" of kimberlite, or diamond matrix.

The subject is of intense interest naturally enough to geologists as well as to diamond miners generally, and a report upon as much of its history as is known at present may be interesting.

Brazilian diamond mining has traditionally been *placer* mining. There may have existed here the vague dream that all *placer* miners indulge in, in all countries, of finding the mother-lode "further up" but these never appeared to attract attention until the arrival in this country, in 1909, of Samuel Draper, the geologist, well known as the discoverer of the Premier mine in South Africa, and an acknowledged expert among geologists on the question of diamond prospects.

It should be remembered that the first orderly attempts at systematizing the geological work of Brazil date back to the early '70's when the country still being under the Empire, Messrs. Branner, Hartt and Derby first visited it and described certain portions of it. Of these three geologists only Dr. Orville E. Derby remained in Brazil, becoming first geologist to the state of São Paulo, and then later, through the efforts of the famous Baron de Rio Branco, being attached to the geological section of the Federal Government's Department of Agriculture and Industry.

It was to the late Dr. Derby that his friend and colleague, Draper, first addressed himself when in 1909 he had completed certain examinations of the Aguas Sujas mine at Baggagem in the State of Minas Geraes. It is a *placer* mine—an ancient conglomerate lying high above the present river levels—and Mr. Draper believed that he had found there traces of a broken-down "pipe" of kimberlite.

Dr. Derby was busied with other things at the time and not until 1913 did he begin seriously to direct his attention to the matter, when Mr. Draper again reopened the question with him and a petrographer in the service of the Brazilian Government, a German named Everard Riemann, at Tiros, a village in the State of Minas Geraes on a branch of the São Francisco river, in the Serra de Matta da Corda, where he believed again to have found evidence of kimberlite.

In 1914 Dr. Derby, who was at the head of the geological work of Brazil, sent Riemann the petrographer, and Horace Williams, a geologist, together on an expedition to Tiros and beyond to investigate. They returned, bringing with them good but still not quite

conclusive evidence, substantiating and adding to Mr. Draper's prognostications.

In 1916 Mr. Riemann went on a mission alone to Tiros and beyond that point. He reported, it is said, the discovery of at least five "pipes" of kimberlite. Toward the close of the year 1915, Dr. Derby made an official report to the Brazilian Government of these conditions, which, I believe, was printed in the *Imparcial* newspaper of Rio de Janeiro of that time. Mr. Draper has stated to me that Dr. Derby, whose kindness and fairness to all his associates had become proverbial here, also sent him a letter about that time acknowledging that to him was due full credit for the discoveries. I am in hope that by another mail I may have obtained for transmission to the department a copy of the letter in question, which has been promised me.

The Brazilian Government, as stated in my report of August 8, has given serious consideration to this matter and is awaiting the reports of a geologist and a petrographer who are studying conditions at present.

Two months ago Dr. Draper returned to Brazil and will now, I am told, continue his investigations of this subject. Their result, as may naturally be supposed with a man of his acknowledged ability, will be awaited with intense interest here.

Plastic Flow.

There is a property of certain forms of matter, such as clay used in making pottery, which has long been regarded as of great importance, but which has never been understood. This property, known as plasticity or the capacity of a material for being molded into a desired shape and then retaining it, has been made a subject of study by the Bureau of Standards, and the results of the study have just been published in Paper No. 278.

Forcing mixtures of clay and water through tubes of small diameter, the rates of flow at different pressures were measured. The experiments showed that, in a plastic substance, a considerable force is required to start the flow or to overcome the friction between the particles of solid. This friction in plastic flow enables one easily to distinguish between a plastic substance and a true fluid, even though the fluid may be very viscous like pitch. It was found that the plasticity of a material depends principally upon the fineness of the solid particles. It can be measured by the force required to overcome the friction, and by the rate of flow after the friction is overcome, this latter quantity being known as the "mobility."

If you don't know the name behind the product, you cannot be sure of the wear ahead of it.

*Consul-General, Rio de Janeiro, Brazil.

U. S. Bureau of Mines on Complex Ore Problems.

A bulletin has been recently issued by the U. S. Bureau of Mines giving in detail the work carried on by Oliver C. Ralston, in a study of the complex ore problems of various mining districts in the west. He visited portions of Colorado, Arizona and California, in all of which the ore problem was studied and the metallurgical plants investigated.

At Pueblo, Colo., there was found a zinc smelter which is the only one in this country running on a zinc-lead basis. The zinc in complex ores of this type is first distilled and the residue is then sent to lead blast furnaces for extraction of the lead, silver and gold. As far as could be learned, most of the zinc, lead, silver and gold values in such ores are being recovered in this plant, but the present ore-buying conditions are such that such a smelter pays for only 60% of the lead in a zinc ore, and at a figure considerably below the market value of the lead, and the same is true of silver. In fact, the present metallurgical margin between the value of the metals in such complex ores and the price usually paid for such an ore is so large that many people are considering entering the field of treatment of complex ores. Throughout southwest and central Colorado are numerous deposits of such complex ores, most of which are not being worked, as the total cost of smelting is at present so high as to make it almost prohibitive to treat the ores.

In New Mexico the magnetic separation plants at Kelly, Silver City and Hanover were visited by Mr. Ralston. Each of these plants is located in the complex ore district, and is making zinc or zinc-lead products from ores contaminated with iron sulphide. The magnetic concentration plants are removing the iron from such ores. It was learned that such large losses of ore were sustained in these plants from dusting, etc., that as a rule one pound of zinc is lost for every two pounds shipped from the mill in a concentrate. On that account methods of treatment of such ore yielding higher recoveries of the zinc should be developed and used. Plans are now on foot for doing this.

At Bisbee, Ariz., it was found that while this mining camp is reputed to be a producer of copper, it is now developing large reserves of lead and zinc ores. Lead carbonate ores, which are very difficult to concentrate, are present in many of the copper mines, and are being exploited in only a few instances. As the Salt Lake station has developed three alternative methods of treatment of such ore during the study of Utah problems, it has been quite easy to get out an immediate solution of the difficulties in this district; and the Shattuck-Arizona Copper Co. has now employed as metallurgist Glenn L. Allen, formerly one of the "fellows" of the department of metallurgical research at the Salt Lake station. It is further learned that in the Junction mine of this district a very large body of com-

plex sulphides of lead, zinc and iron has been developed. These are very similar to the Colorado complex ores.

In the Chloride-Kingman district of Arizona considerable activity is now going on in the mining of complex ores, and throughout Arizona at various places are locations where this type of ore is being developed.

At Los Angeles Mr. Ralston visited the plant of the Stebbins Dry Concentrator Co. In many of the intermountain mining camps not enough water is available for milling purposes, and it has been found that many of the lead and zinc ores of lower grade are not being concentrated, due to this deficiency; hence a study of the various methods of dry concentration will some time be taken up by the Salt Lake station. The plant of the Western Precipitation Co. at Los Angeles was also visited and samples of some strange products for testing in flotation were obtained. This company is exploiting the Cottrell precipitation process, and in passing petroleum and other oil vapors through a Cottrell treater some strange new products were obtained, which promise to be good "frothers" for flotation work.

Rock Drill with Flooding Attachment.

A pneumatic rock drill is shown in this illustration, which embodies an arrangement whereby the drill hole is continuously washed out by a stream of water as the drilling proceeds. The hollow handle, with the pneumatic piston which drives the crank to operate the drill, is shown, as well as a part of the drill itself. In the sleeve is inserted the water pipe (32), which extends nearly to the drill point. It is secured to the

ROCK DRILL WITH FLOODING ATTACHMENT.

drill by a series of ears (35) shown in the sectional view. The pipe slides through these ears as the drill operates back and forth. Since the point of discharge of the water pipe is at all times directed at the drill point, the drill hole is continuously flooded and the drilled out material washed away. William A. Smith of Denver, Colo., is the inventor, and he has assigned one-half of his patent to William W. Hassell, Colorado Springs, Colo.

For the water-supply wells now being sunk in semi-arid regions, air-lift pumps are coming into service, particularly where the air can be piped from a mine compressor connected with an electric power line.

Tractors Hauling Ore in Salt Lake Valley, Utah

After a demonstration the Utah-Idaho Motor Co. proved conclusively to the officials of the Cardiff mines that it could haul the ore from the mines to the smelters in the Salt Lake valley, Utah, and coal and other supplies back to the mines by tractors. Teams were formerly employed at a great expense to haul the ore from the mines down the canyon.

Following is a brief synopsis of the results of 11 demonstrations: The equipment consisted of one model 36 Knox tractor, with 5-ton ore body, and two 5-ton Troy trailers, equipped with regular steering apparatus, roller bearings and 36 by 7-in. tires. On the down trip from the mines the trailers were practically always held back by the brakes on the tractor; in many places the grades are as steep as 16%.

24 hours, the average time coming down being 3½ hours and returning 4½ hours, which, with allowing 1 hour for loading and unloading, gave 3 hours for oiling, taking on gas and inspecting the machine. No repairs of any nature were necessary during the 11 trips. The distance covered on each trip down included 9 miles in the canyon proper, and 7 miles across the valley, which included one very steep hill. The radiator showed signs of boiling at no stage of the demonstration. Considering that a rise of 3050 ft. is negotiated in this trip of 16 miles, 7 of which are across the valley, the fact that the radiator did not overheat is even more remarkable.

The company which has the contract for hauling ore from the Cardiff mines to the smelters reports

KNOX TRACTOR HAULING ORE FOR THE CARDIFF MINING CO., UTAH.

Traffic was never interfered with in any manner, on account of the fact that the Knox tractor could pass as easily as the ordinary automobile. The tractor was equipped with steel wheels 14 ins. wide, which were fitted with diagonal cleats. After the 11 trips up and down the canyon no appreciable wear was noticeable on the tires. Some of the demonstrations were made during heavy rainstorms and no difficulty in negotiating the trip was encountered at any time.

The total tonnage of ore hauled during these 11 demonstrations was 272,660 lbs., and, although coal was not taken back on every return trip, a total of 27,080 lbs. of coal was hauled back from the valley up to the mines. The amount of coal hauled per trip ranges from 3600 to 4300 lbs.

An average gas consumption of 21 gals. per round trip was registered, and the road trip consumption of oil averaged 2 quarts. Two trips were made every

utmost satisfaction with the performance of the tractors. Their records show an average of 20 tons of ore per tractor each trip and that the schedule of the trips does not vary 7 minutes.

The present output of benzol and toluol in the United States is conservatively estimated at 3,500,000 gals. per month, or 42,000,000 gals. per year. Of this total 3,000,000 gals. each month is benzol. When the new by-product ovens still under construction are completed the yearly output will easily exceed 50,000,000 gals. per year. Before the war this output was inconsequential in comparison.

Nitrate production in Chile in November totaled 5,100,000 quintals. Output is increasing and sales are being contracted for next two years at highest prices yet reached.

The Nevada-Utah Property at Pioche, Nevada.

STAFF CORRESPONDENCE.

Consolidated Nevada-Utah Corporation, having about 10,000 shareholders, owns and operates the old Raymond & Ely mines at Pioche, Nev., H. R. Van Wagenen being manager. The group covers 4500 ft. along the strike of the Raymond & Ely fissure, and 4000 ft. of the Yuba dike. The fissure, which is in quartzite, strikes east-west and dips 70° south. Yuba dike is porphyritic and mineralized, and has a width

MILL AND SHAFT OF CON. NEVADA-UTAH AT PIOCHE, NEV.

of 10 to 40 ft. Dike and fissure come together and strong ore bodies occur at and near their junction point. The main working shaft has a depth of 1450 ft. It starts in the hanging wall of the fissure and cuts the vein at 650 ft., passing then into the foot wall. The ore from surface to the water level, at 1200 ft., consisted of lead carbonate and chloride of silver; below water level are sulphides of lead and zinc, both carrying silver. Operations now are mostly in the sulphides between the 1200 and 1400 levels, close to the Raymond & Ely and Yuba contact.

The mine water is handled by a Cameron pump at the 1440 station, an Epping-Carpenter at the 1200, and another of same pattern at the 600. These lift 165 gals. per minute, all water being taken from the 1400 level. Pumping to the surface continues 16 hours each day, and during the remaining 8 hours the water is pumped only to the 1200, there discharging from a tank into a metal pipe line 700 ft. long, by which it is carried laterally beyond a bulkhead where it sinks. The hoisting is done by an Ottunwa geared, double-drum hoist, operating one cage in balance. The air compressor is the Ingersoll-Rand piston inlet, duplex, 2-stage type, of 600 cu. ft. capacity. The pumps, hoist and compressor are steam operated.

The mill was completed and put in operation in April, 1916. Its machinery is driven by two 25-hp. and one 100-hp. gasoline engines, using 33 to 34 gravity light oil known as "tops." About 60 tons of ore per day is crushed and concentrated by tables and

flotation machines, making a lead concentrate that samples ½ oz. gold, 60 ozs. silver, 20% lead, the balance being iron; also, making a zinc product running about 42% zinc, accompanied by silver and iron. The output of the mill is about 20 tons per day of zinc concentrates, and 1 ton of lead concentrates. These, of course, are shipped separately, the zinc product being sent to the U. S. Zinc Co.

The mill flow sheet is as follows: The ore is reduced to 1½-in. size by a jaw crusher, then to 16 mesh by a Marcy 5 by 4-ft. mill. This material is then concentrated over two Overstrom-Deister tables, making a lead and zinc concentrate. The table tailings are reground to 42 mesh in a Power & Mining Machinery Co. tube mill, and is reconcentrated on two Overstrom tables, making finer lead and zinc products. These table tailings, after passing through a Dorr thickener, are concentrated by flotation, in which Callow machines are used—3 roughers and 1 finisher. The tailings from the roughing machines are reconcentrated by two Overstrom tables, by which a zinc-iron product is made, the table tailings passing to waste. The tailings from the Callow cleaner cells are passed back into the flotation circuit.

A rotary blower is used for supplying air for the flotation machines. In the tube mill broken quartzite rocks are used instead of imported pebbles. The cleaner machine concentrates are passed to an agitating tank to settle the froth, and this is followed by decanting the water; the product is then reduced to 9% moisture by a Portland filter. The flotation concentrates are mostly zinc, accompanied by silver.

Non-Cutting Belt Fastener.

Belt fasteners of the staple type, which consist of teeth or prongs to be driven through and then clinched, usually have sharp edges or projections which cut the fibers of the belt when under pulling strains. A belt fastener in which the teeth are fashioned with rounded

NON-CUTTING BELT FASTENER.

inner surface, smooth and free from sharp edges, has been patented by Nicholas P. Mader of Beaumont, Calif. The illustration herewith shows the general conformation of the tooth.

Exports of copper from Atlantic ports for the week ending Dec. 7 were 5597 tons; since Dec. 1, 5597 tons; a year ago, 15,444 tons.

Electric Smelting at Heroult, Calif.

The Noble Electric Steel Co., San Francisco, has operated continuously its electric smelting plant at Heroult, Calif., since April 15, 1916, turning out a ferromanganese product. Previous to that date the plant had been operated intermittently since 1911. The furnace has undergone several changes, the one now in use having been evolved after special experience with several original types. It is described as the

H. H. Noble, San Francisco, is president of the company; E. E. Mead, secretary. W. W. Clark is metallurgist, at the plant.

Trolley Splicer with Smooth Under-run

This trolley wire splicer is so made that it has a smooth under-run surface, there being no saw cuts or shoulders at the inner ends of the lips which embrace the wires. The grooves which receive the wires are

NOBLE ELECTRIC STEEL CO.'S PLANT AT HEROULT, CALIF.

Frickey open delta, split-phase arrangement of electrodes. It is considered a success on ferromanganese ores, the smelting of which was begun in 1914. The closing down at intervals is said to have been due to a shortage of ore of the kind mentioned. The ore smelted varies, but much of it runs 46 to 48% metallic manganese, 14 to 16% silica, and 2 to 3% iron. It is claimed the plant can be successfully operated on ore as low as 40% manganese, and as high as 20% silica. Other elements in the ore are sulphur, 0.01%; phosphorus, 0.1%; carbon, 6.5 to 6.75%. The furnace product contains 80.5 to 81.5% manganese. The plant capacity is 9 tons per day, but this is to be increased. The product is marketed on Pacific coast mostly, though some shipments are made to the eastern states. The ore is mined by the company at several places in California, and a manganese property is being developed in Nevada.

This company, in 1915, began developing and mining chromite ore on a number of properties it had previously acquired in California. Part of the ore tonnage is shipped east, and a part is smelted at the Heroult plant by methods practically similar to those employed in ferromanganese smelting. The analysis of average ore shows 30% chromic oxide, 13% ferrous oxide. The furnace product is a ferrochromium containing 60% chrome oxide and 30 to 32% iron oxide. This class of ore occurs in lenses in serpentine. Heroult camp is on Pitt river, 26 miles from Redding.

inclined upward slightly from the ends of the splicer, forming bendable lips. These lips increase in thickness from the tips of the splicer to the inner ends, where they are of sufficient thickness to withstand the

TROLLEY SPLICER WITH SMOOTH UNDER-RUN.

pounding action of the trolley wheel. When the lips are properly bent around the end of the wire, they form a gradual and smooth approach, so that the wheel will not have a tendency to jump.

According to the Department of Commerce, October imports of copper totaled 34,577,885 lbs., against 36,578,445 lbs. in September. Exports in October totaled 64,713,082 lbs., against 70,905,317 lbs. in previous month.

Money Loss Due to Boiler Scale.

It has never been disputed that boiler scale is a bad thing—that it is and has been the cause of much money loss. The actual money loss due to a definite thickness of scale is a variable quantity, for much depends upon the “kind” of scale, whether carbonate, sulphate, hard, soft, etc.

The most used rule for determining the money loss is given in Sames’ Mechanical Engineering Handbook as follows: “Scale of 1-16-in. thickness will reduce boiler efficiency $\frac{1}{8}$, and the reduction of effi-

CHART SHOWING LOSS DUE TO BOILER SCALE.

ciency increases as the square of the thickness of scale.”

The chart herewith is based, therefore, upon the above rule. It covers all scale thicknesses from .01-in. to 0.1-in., and for convenience shows thicknesses in fraction as well as in decimals of an inch. The dotted line indicates that where \$8000 is spent per year for coal, \$1000 per year is lost due to a scale 1-16-in. thick.

Whatever your scale thickness and whatever your coal costs per year (up to \$10,000), this chart shows the money loss in strict accordance with the given rule. It may help you to decide upon a water treating device or it may show how often your boilers should be cleaned.

Stamp Mill with Rotating Heads.

The heads in the ordinary stamp mill are subject to rapid wear, which, moreover, is not evenly distributed over the surfaces of the heads. It was thought to decrease the wear and also to distribute it evenly by rapidly revolving the heads at the same time they are reciprocated, an idea of Richard Raycraft, of Genoa, Nev. The accompanying diagrams explain the operation. The stamp shafts are reciprocated vertically by means of the upper horizontal shaft turned by the crank at the right, tappets on the shaft performing this operation. At the same time another shaft below is turned by gear wheels, as shown, and

STAMP MILL WITH ROTATING HEADS.

this second shaft carries worm gears, one for each stamp shaft. These worms engage rather long gears on the circumference of the stamp shaft and rapidly revolve the latter as they do their work.

Ferromanganese Imports in October.—Ferro-manganese imports into the United States in October were 7914 gross tons, against 9237 tons in September and 8515 tons in August. The October receipts bring the monthly average to 6289 tons for the first nine months of this year. The imports in 1915 were only 4600 tons per month. Of the October imports 2641 tons came through Philadelphia, 2657 tons through Baltimore, 1113 tons through New Orleans, 880 tons through Newport News and 623 through New York. The entire receipts were from Great Britain except 203 tons from India through New York.

What the Mining Companies are Doing

Shattuck-Arizona.

The production of the Shattuck-Arizona Copper Co. for November is given in the following table, with a comparison of the previous months in the year:

	Copper, Lbs.	Lead, Lbs.	Silver, Ozs.	Gold, Ozs.
November	1,536,723	458,153	22,531	282
October	1,663,671	335,008	35,995	361
September	1,566,446	233,800	26,923	419
August	1,699,575	253,143	30,542	608
July	1,397,445	174,091	22,525	314
June	1,446,030	61,889	24,636	367
May	1,383,963		25,865	326
April	1,366,830	130,570	19,849	353
March	1,594,330	714,379	32,187	393
February	1,523,137	499,155	27,139	630
January	1,565,224	267,853	30,369	514

This makes total production for 11 months of 16,743,421 lbs. of copper; 3,128,041 lbs. of lead; 298,566 ozs. of silver and 4471 ozs. of gold.

Butte and Superior, Mont.

The Butte & Superior Mining Co. in November produced 15,158,000 lbs. of zinc in concentrates, a decrease of 536,000 lbs. from October. Production of silver was 312,000 ozs., against 320,000 ozs. in October. Two months compare as follows:

	November.	October.
Ore milled—tons	53,880	54,450
Tons concentrates	14,300	14,850
Concentrates assayed	53%	52.72%
Zinc recoveries	93.7%	92.5%
Total zinc in concentrates, lbs.	15,158,000	15,694,000

Old Dominion, Ariz.

The old Dominion smelter output in November was 3,650,000 lbs., compared with 3,200,000 lbs. the previous month. Comparison of monthly outputs follows (in lbs.):

	1916.	1915.	1914.	1913.
January	3,121,000	1,745,000	2,797,000	2,727,000
February	2,823,000	2,074,000	3,066,000	2,381,000
March	3,277,000	603,000	2,997,000	2,953,000
April	3,290,000	1,338,000	2,779,000	3,040,000
May	3,405,000	2,868,000	3,303,000	2,749,000
June	3,843,000	2,744,000	2,937,000	2,611,000
July	3,852,000	3,199,000	2,962,000	2,526,000
August	3,600,000	2,843,000	2,236,000	2,524,000
September	3,011,000	2,538,000	3,121,000	2,679,000
October	3,200,000	2,970,000	1,616,000	2,037,000
November	3,650,000	2,443,000	1,924,000	2,170,000
December		2,495,000	1,700,000	2,613,000

East Butte Copper, Mont.

The November copper production of the East Butte Copper Co. was 1,640,040 lbs., compared with previous months as follows (in lbs.):

Months:	Copper, lbs.	Months:	Copper, lbs.
November	1,643,040	May	1,517,000
October	1,650,160	April	1,501,000
September	1,760,100	March	1,306,900
August	1,849,120	February	1,277,160
July	1,893,120	January	1,060,000
June	1,639,560		

Silver production compares as follows:

	November.	October.	Sept.	August.
Silver, ozs.	51,520	51,022	46,239	49,449

Directors of the East Butte Mining Co. will meet this month to take action on a dividend declaration which is expected will be for \$1 a share. The estimated profits of the company for October were \$256,000, which was at the rate of better than \$7 per annum on 411,000 shares. The company has \$2,000,000 in cash and copper at the present time. East Butte's production has been ranging between 1,600,000 and 1,700,000 lbs. of copper per month and one-third of the output comes from the 1500-foot level.

Costs of production have risen along with other companies due primarily to increased wages and higher costs of materials. Advantage has also been taken of the high price

for copper to work on war-grade ores than would otherwise be possible and this treatment has added somewhat to the copper costs, which in the year 1915 averaged 11.85 cts. a pounds.

Miami Copper, Ariz.

Miami Copper Co. production in November mounted to 4,968,500 lbs. Comparisons with previous months are shown:

	1916.	1915.	1914.	1913.
January	3,892,468	1,807,928	3,136,069	2,934,670
February	3,934,320	2,441,719	3,162,958	2,691,343
March	4,236,791	2,958,922	3,287,749	2,929,103
April	4,114,338	2,976,218	3,210,451	2,217,630
May	4,729,328	3,634,100	3,224,657	1,836,128
June	4,516,395	3,756,992	2,997,171	2,727,457
July	4,310,000	4,084,863	3,107,843	2,780,479
August	4,698,795	4,039,517	1,993,104	2,952,759
September	4,381,367	4,081,444	2,103,616	2,551,930
October	4,859,443	4,094,957	2,318,527	2,821,300
November	4,968,500	4,075,194	2,265,829	3,084,184
December		3,880,205	2,488,036	3,340,692
Total		41,822,059	33,296,010	32,867,666

Braden Copper Co.

The company produced in November 4,419,000 lbs. of blister copper, comparing with previous months as follows:

	1916.	1915.	1914.	1913.
Six months	23,110,000	15,238,000	12,451,000	8,438,000
July	2,760,000	2,890,000	1,332,000	1,046,000
August	2,616,000	2,858,000	4,532,000	1,572,000
September	2,970,000	3,222,000	3,130,000	1,332,000
October	4,048,000	3,726,000	2,078,000	2,006,000
November	4,419,000	3,684,000	2,402,000	1,592,000
December			2,298,000	2,122,000

Kennecott Copper.

Kennecott Copper Corporation's production was 7,080,000 lbs. of copper in November, comparing with previous months as follows:

	Pounds.		Pounds.
November	7,080,000	May	10,500,000
October	7,300,000	April	10,500,000
September	8,000,000	March	10,150,000
August	10,200,000	February	9,750,000
July	10,750,000	January	10,000,000
June	10,500,000	December	10,500,000

Tennessee Copper Litigation.

Following the decision of the Appellate Division in reinstating four attachments made against properties of the Tennessee Copper Co. in New York state in suits of W. H. Stiner & Son, four motions have been made in the Supreme Court for dismissal of suits brought by the Tennessee Copper Co. against the surety company which guaranteed payment of damages and costs in case the attachments were vacated.

The Tennessee Copper Co. instituted counter suits against William H. Stiner & Son, to offset the four suits brought against the company by Stiner, in which damages amounting to \$986,000, are claimed for breaches of contract. After these suits were commenced in the Supreme Court of the state of New York, attachments against all the property of the Tennessee Copper Co. in the state were issued. On motion before Justice Goff, in the Supreme Court, these attachments were vacated, whereupon an appeal was taken by Milton Mayer, counsel for W. H. Stiner & Son in the Appellate Division which reversed Justice Goff's decision.

Justice Laughlin of the Appellate Division, who wrote the opinion, in which all the other justices concurred, said: "Each of these actions is brought to recover damages for breaches of a contract. The contracts and the alleged breaches are in all respects similar. Action No. 1 has been argued and is to be decided herewith. Therefore, it is the unanimous opinion of the court in so far as relates to the causes of action for damages for breaches of contract, this decision applies to, and is decisive on the questions arising on these appeals.

It follows that the order in each action should be reversed with costs and disbursements, and the motions to vacate the attachments in each action denied with costs, and the attachments are reinstated."

Alaska Gold.

The November report of Alaska Gold Mines shows that 167,600 tons of ore were milled, assaying an average of \$1.13 per ton. Percentage of gold extraction and loss of gold in tailings compare as follows:

	Tons ore milled.	Assay value per ton.	Per cent of extraction.	Loss in tails per ton.
November	167,600	\$1.13	81.71	20.7c
October	158,000	1.32	82.49	..
September	135,760	1.30	82.94	..
August	169,100	1.38	81.51	25c
July	150,403	1.24	80.64	24
June	164,800	1.06	79.25	22
May	175,215	1.40	82.85	24
April	165,930	.94	78.71	19.8
March	162,796	1.03	77.47	20.3
February	122,856	1.02		
January	119,914	1.42		
December	114,183	1.36		

Greene-Cananea.

Greene-Cananea Copper Co.'s November results compare with previous months as follows:

	Copper, lbs.	Silver, ozs.	Gold, ozs.
November	5,100,000	164,360	951
October	6,030,000	177,999	915
September	4,900,000	153,495	814
August	5,000,000	144,480	862
July	4,600,000	116,800	745
June	4,500,000	128,700	800
May	5,948,000	183,809	1,199
April	5,348,000	205,748	1,193
March	5,388,000	200,709	1,146
February	5,180,000	181,895	984
January*	3,348,000	113,691	716

*Does not include eustom ores.

Goldfield Con., Nev.

Operating costs at the Goldfield, Con. for October are given in the following table:

	Per Ton Ore Handled.	Per Ton Total Ore.
Mining—		
Stoping	\$ 2.40	\$....
Development	13.48
Total mining	\$ 2.74	\$2.35
Tailings dump moving	.16	.02
Transportation	.06	.06
Milling	2.05	2.05
Marketing	.02	.02
General expense	.24	.24
Bullion tax	.01	.01
Filter royalty	.04	.04
Flotation royalty	.04	.04
Surface	.05	.05
Total operating costs	\$4.88
Miscellaneous earnings10
Net operating costs	\$4.78

During the month of October, 1916, the total production of the company was 30,000 tons from which resulted net realization of \$17,045.51.

Miscellaneous Company Notes.

November production of Greene-Cananea totaled 5,100,000 pounds of copper, 161,360 ounces of silver and 951 ounces of gold. October's copper production was 6,030,000 pounds.

The Utah Metal & Tunnel Co. and Bingham-New Haven Co. combined operating accounts for the 9 months ended Oct. 1 last show total income of \$1,299,914, and net profits of \$567,177, equal to about \$1.20 on the company's 685,266 shares. The company has cash in bank amounting to \$197,677,

and cash due for ore sold amounting to \$176,104. During the nine months the company reduced its bonded debt by \$145,500 leaving outstanding \$229,500, and paid its initial dividend in August, amounting to \$342,472.

Application has been made for listing Davis-Daly on the Boston Stock Exchange. Papers are understood to have been satisfactory and trading on the regular Exchange should start within a few days.

At the annual meeting of the Superior & Boston Copper Co., the former directors were re-elected. The company announced its intention of starting at the 1400-foot level to crosscut in direction of the Old Dominion vein.

The Nichols Copper Co. has resumed dividend payments with a declaration of \$4 a share, payable Dec. 22. The company owns and operates what was once the largest copper refinery in the world. For several years it was the only plant in the country having a daily capacity for refining 1,000,000 lbs. of copper. That capacity has since been increased to about 35,000,000 lbs. of copper a month, but the Anaconda refinery at Perth Amboy, New Jersey, has an equal capacity while the Baltimore refinery of the American Smelters Securities Co. has a present capacity of 40,000,000 lbs. of copper monthly. Control of the Nichols Copper Co. has always rested with the Nichols family, Dr. W. H. Nichols, chairman of the General Chemical Co. and president of Granby Con., being credited with the largest interest. The Nichols refinery refines the Phelps, Dodge & Co., Granby and Old Dominion product.

A renewal of the option from the Calumet & Hecla Mining Co. carrying control of the Seneca Mining Co. has been secured by Tucker, Hayes & Bartholomew of Boston in association with Lewisohn Bros. of New York. The company has 20,000 shares, of which 11,207 shares are owned by Calumet & Hecla. It is proposed to form a new company under New York laws with 250,000 shares, no par value. The stock will be made non-assessable. At the present time only 200,000 shares will issue, 50,000 shares to remain in the treasury for future requirements. The new stock will be offered for subscription, without commission to brokers, at \$15 per share. Incidentally, the minority interest in Seneca will be offered \$60 per share cash for their holdings and an opportunity to subscribe to the new stock at \$15. This arrangement will give the new company a working capital of something over \$1,000,000.

Ray Hercules Copper Co., whose properties adjoin the producing properties of Ray Con. Copper Co., of which they are an extension, originally intended to construct a mill having a daily capacity of 1000 tons of ore, but recently it has been decided to start production with a mill having a daily capacity of 2000 tons. It is estimated that ore in sight will last 14 years and yield a profit of at least \$2.10 a ton, or \$21,000,000 on 15-ct. copper and about \$55,000,000 on 25-ct. copper. Expectations are that Ray Hercules beginning with next September will start production at 25,000,000 lbs. of copper a year at a cost not to exceed 8½ cts. a pound. Estimates place earnings thereafter at \$1.25 a share on 15-ct. copper and \$3.50 a share on 25-ct. copper. Ray Hercules now has \$1,200,000 cash, compared with close to \$1,000,000 on July 1. This item is regarded as ample to finish the concentrator and prepare the mine for stopping.

A new management has taken over control of the Tennessee Copper Co. through the Tennessee Copper & Chemical Corporation, which was formed to finance the older concern and furnish it with working capital. Succeeding Utley Wedge as president, Adolph Lewisohn has been elected; S. A. Lewisohn has been chosen vice-president, and E. H. Westlake, secretary and treasurer. The new board of directors comprises: Adolph Lewisohn, S. A. Lewisohn, S. S. Rosenstamm, E. H. Westlake, J. H. Susman, J. Parke Channing, J. S. Bache, H. M. Kilborn, Richard Sutro, W. B. Joyce, Martin Vogel. The last four hold over from the former regime. But little stock of the Tennessee Copper Co. has not signified intention of depositing for shares of the new Tennessee Copper & Chemical Corporation. Holders of the new shares will have the opportunity to subscribe at \$16 a share for stock of the new corporation on the basis of one share of new for each share of old held.

Butte Miners' Wages Again Voluntarily Advanced.

Butte mining companies have announced an advance in the wages of miners from \$4.50 to \$4.75 per day, effective after Dec. 1. This is done without altering or changing any existing contracts or obligations. The advance applies not only to the mines of Butte but to the men employed in the reduction works and plant at Anaconda and Great Falls. The price of copper is to be computed in the same way as in the past.

All salaried employes of the Anaconda Co. receiving \$300 per month or less will receive an additional 5% on the base rate as long as the average monthly price of copper remains at 27½ cts. per pound or more.

This is the third voluntary increase in the wages of the employes of the Anaconda and other mining companies of Butte in the past year. The increase, it is estimated, applies to between 20,000 and 25,000 men in the district. It will mean an increase in the daily wages of Butte, Anaconda and Great Falls of between \$5000 and \$6000 and a monthly addition to the pay rolls of approximately \$150,000. This is at the rate of an annual increase of \$1,800,000.

It will affect 4500 men employed at the Washoe smelter at Anaconda, 3000 men employed in the reduction works at Great Falls and 17,500 men employed in the mines and mills of Butte.

The pay rolls for the month of December, estimated on the basis of the number of men employed at present, will run between \$3,000,000 and \$3,500,000. It will be by far the largest pay roll in the history of the Butte mining district.

The companies joining in the advance are the Anaconda Copper Mining Co., the Elm Orlu Mining Co., the Timber Butte Milling Co., the Davis-Daly Mining Co., the East Butte Mining Co., the East Butte Extension Co., the Tuolumne Mining Co., the Butte & Bacorn Co., the Bullwhacker Mining Co., the Butte & Great Falls Mining Co., the North Butte Mining Co., the Butte & Superior Mining Co., and about 25 other small mining companies.

The Pig Iron Situation.

Sensational advances in the prices of pig iron have stimulated buying and predictions are freely made that there will result a serious shortage. Operations at furnaces have been greatly handicapped by a shortage of coke and several have had to shut down for short periods. The one consolation is the almost entire absence of labor troubles, a few plants only being affected.

Pig iron is now selling at around \$30 per ton, and a prominent maker predicts price may reach \$50 before it begins to recede, based on higher cost of iron

ore, coke, shortage of labor, fuel, and above all enormous demand. If the quotations should reach \$50 per ton, or anywhere near that point, they will be the result of increased consumption rather than cost of manufacture. Iron ore and freight rates may increase cost of production next year by about \$2.50 per ton. Contracts for coke are being based around \$3 a ton and less, and labor may receive an increase in wages. With all added details of cost, pig iron selling around \$30 a ton is being made at a handsome profit.

Large sales have been few, as it is practically impossible to obtain a great volume of either bessemer or basic. A sale of 22,000 tons of basic was made for delivery during second half of 1917 at about \$26. Interests who have not as yet filled requirements are in the market for around 50,000 tons of malleable iron.

Export demand is increasing steadily. Inquiries from all countries of Europe except the central powers aggregate more than 100,000 tons. Italy is in the market for about 25,000 tons of bessemer. French inquiries amount to over 30,000 tons.

Iron production in October amounted to 3,510,000 tons, a new record, and at rate of 41,000,000 tons per annum. The previous record production was in May, 3,365,000 tons.

The Situation in the Silver Market.

The silver market has been swept more clear of supplies and a further advance in rates is predicted by Samuel Montagu & Co., of London. This increase in rates became unavoidable owing to continued strength of the China exchanges which led to purchases in America and also in London. Inquiries embraced mintage orders, orders for general purposes, and for Indian bazaars. The bearish view of the Indian bazaars had led to bearish selling in London, putting the market in a strong technical position, which is, in view of statistical conditions, not without danger.

Conditions are now more sound than when the spectacular movement in May carried the quotation to high records. During the intervening time the Chinese stock has been greatly reduced. America has been relieved of certain accumulations she then held, and the Indian currency figures, notwithstanding very large continuous purchases for the Indian mints, show a declining tendency. The silver market has often lived up to its reputation of doing the unexpected, but the situation is such that further advances may be looked for before the close of the year, provided no new factor intervenes.

The higher price of silver will reduce cost of production of the prominent metal companies, as value of gold and silver in the ore is used as an offset to reduce the cost of producing. Anaconda, for instance, is a bigger silver producer than most silver mines, and the increasing copper output of that company means

an increasing silver output. The same applies to other coppers, as Utah and Granby. Butte & Superior with its November production of 15,158,000 lbs. of zinc concentrates produced 312,000 ozs. of silver. All the smelting companies treating custom ore profit from advancing silver prices.

Labor in the Lake Superior Region.

The Lake Superior labor situation has become vastly improved and is now in an entirely satisfactory condition. The number of men employed is increasing steadily now that winter is ahead, and the men are doing more work. That applies particularly to contract mining and tramping where the pay is remarkably high.

Ten years ago there was a plan on foot to do away entirely with contract mining—the old Cornish mining system that came to the Lake Superior district with the first copper miners. Some of the mines applied the plain day wage system to all miners. But in recent years more and more of the mines have gone back to the contract system. When the Calumet & Hecla took over the Fay mines and the Bigelow mines they instituted the contract system, which has always been popular with Calumet & Hecla. It has resulted in greater efficiency. At present the men are making very heavy wages. Miners that are able to get better than \$200 a month are not now exceptional.

Lake Superior miners, 17,000 out of the 25,000 employed in the copper mines, will participate in a bonus distribution on the first payday in January, 1917. This bonus was announced last summer. It is additional premium, over the regular increase in wages, of 25 cts. for every day for every employe who worked from July 1 to Dec. 31. It applies to men who worked steadily. The bonus payment at the Wolverine and Mohawk mines will be made on Jan. 15 at the time of the regular pay.

In graceful recognition of earlier successful work and the naming of a town after him, J. Parke Channing is to present a modern up-to-date clubhouse to the employes of the C., M. & St. P. railroad and to the population in general at Channing, Mich. In 1893 Mr. Channing examined that region geologically to determine the trend of the ore-bearing ground, and a branch railroad to Ontonagon was built along the line indicated by him. The clubhouse, which will be one of the best of its type and equipped with baths, reading rooms, bowling alley, billiard and rest rooms, will be maintained by the railroad company, which presented the site.

Advices from Washington are to the effect that the U. S. Supreme Court has upheld the patents for the flotation concentrating process of the Minerals Separation, Ltd. An infringement injunction was ordered against James M. Hyde.

PERSONAL.

C. Leonard Ball, mining engineer, Bisbee, Ariz., will leave for New York on Dec. 19.

Archie McDonald has been appointed superintendent of the United Copper Co., Chewelah, Wash.

A. L. Waters, mining engineer, Los Angeles, Calif., has been on professional duties in Globe, Ariz.

Thomas Christian, Chicago, is in Custer City, S. D., inspecting mica properties which he owns there.

R. C. Berlin, superintendent of the Golden Chest Co., Murray, Idaho, is on a visit to New York city.

A. C. Barrett, mill foreman for the Backus & Johnston Co., Casapalca, Peru, has returned to the United States.

R. W. Marston is to be acting manager of the smelter at Northport, Wash., in place of Samuel James, deceased.

Samuel Colt, superintendent of the Princeton mine, Dolomi, Alaska, is spending the winter in Nevada City, Calif.

Ben R. Labaree, mining operator of Juneau, Alaska, is spending the winter in Spokane, Wash., at the Davenport hotel.

Murray Godbe, Salt Lake City, general manager of the Prince Con. Mining & Smelting Co., Pioche, Nev., is at the property.

J. B. Tyrrell, of Toronto, is in the East Kootenay district of British Columbia examining and sampling a silver-lead mine.

Otto Ruhl, of Ruhl & Stewart, mining and civil engineers, Joplin, Mo., has completed a two weeks' examination in northern Arkansas.

Roy Grissom has left the employ of the Chino Copper Co., Santa Rita, N. M., for Valparaiso, Chile, where he will enter the employ of the Braden Copper Co.

D. R. Thomas, formerly with the Moose Mountain, Ltd., Selwood, Ont., has been appointed mine superintendent of the Davidson Gold Mines, Ltd., Porcupine, Ont.

M. G. Rodearmel, president of the old Interstate Co., and now holding a large interest in the Interstate-Callahan Co., is in Wallace, Idaho, from Minneapolis, Minn.

J. Cleveland Haas, mining engineer, Spokane, Wash., has returned from Ainsworth, B. C., where he was in connection with the Wolverine Mining & Development Co.

William H. Reeves, formerly manager of the East Hercules Ext. Co., Burke, Idaho, is now superintendent of a station of the Montana Power Co., at Crow Creek, Mont.

A. J. Canavan, formerly superintendent of the Goldfield Con. Co., Goldfield, Nev., has recently been made general mine superintendent of the Pioneer Con. Mines Co., Pioneer, Nev.

George S. Rice, chief mining engineer for the U. S. Bureau of Mines, Washington, D. C., is inspecting the coal mines near Fernie, B. C., for the provincial government of British Columbia.

G. Komorowski, metallurgical engineer, representing the Girod electric furnace, recently arrived in New York from France. His headquarters are with C. W. Leavitt & Co., 30 Church street, American agents for this furnace.

George A. Burrell, formerly in charge of research work in gas and related investigations for the Bureau of Mines, has resigned his position to enter consulting work, and has opened an engineering office in the Benedum-Trees building, Pittsburgh, Pa. Mr. Burrell has been with the Bureau of Mines for 12 years, and is well known for his work and

publications on mine gases, natural gases, gasoline and illuminating gas.

Benj. F. Sparks, who, with his partner, Williard J. Smith, both Michigan College of Mines men, comprise the firm of Smith & Sparks, contractors, of Houghton, Mich., will pass the winter in Detroit superintending cement construction work for the Rockwood Silica Sand Co.

H. R. Graham, superintendent of mines for the Braden Copper Co., Rancagua, Chile, is making a tour of inspection of the copper mines of the United States. He has recently been in Salt Lake City, Utah, and will return to Chile via New York immediately after the first of the year.

W. J. Elmendorf has become associated with Campbell-Wells Co., engineers, metallurgists, chemists, 114 James street, Seattle, the new firm name to be Campbell, Wells & Elmendorf. Mr. Elmendorf is well and favorably known throughout the West, having had 25 years' experience in the United States, Canada and Mexico, as mining engineer, mine manager and mill designer. A new testing plant completely equipped is to be installed.

OBITUARY.

Howard Gray, a mining operator in Parral, Chihuahua, Mexico, was shot and hung by Villa followers during a recent raid on the city. He was born in Peoria, Ill., and went to Mexico about 23 years ago at the age of 25. He leaves a wife and five children in Parral.

Tony Jacobson, an extensive operator in the Alta district of Utah, recently passed away in Salt Lake City. Mr. Jacobson had considerable to do with the opening and placing of the Alta district before the public. In recognition of this a committee has been appointed to erect a monument to his memory. Among those with whom he was closely associated are George H. Watson, Frank Mozley, and other operators of the district.

Samuel James, manager of the Northport smelter, Northport, Wash., died at his home on Nov. 25 from apoplexy. He was born in Boston, Mass., in 1854 and graduated from the Massachusetts Institute of Technology in 1876. He first came to the west in 1889 as superintendent of the Globe smelter, near Denver, Colo. In 1891 he took charge of the Mingo smelter at Murray, Utah. His next change was back to Colorado, where in 1901 he became manager of the Arkansas Valley smelter at Leadville and in 1903 he resigned this position to accept the superintendency of the Ohio & Colorado smelter at Salida, Colo. About 1907 he became interested in Matehuala, Mexico, and remained there until last year when he was selected as manager of the Northport smelter.

SCHOOLS AND SOCIETIES.

Colorado School of Mines.—The third annual short course for prospectors will be given at Golden during the 4 weeks beginning Feb. 5 and ending March 3, 1917. It is good training for the prospector, miner and mill man. If you contemplate attending, notify the secretary.

Lake Superior Mining Institute.—It has been practically decided to make the trip to Birmingham, Ala., as proposed at the last annual meeting. The trip will be made during March and to date it is expected that at least 150 of the members will take advantage of the trip. The present program calls for a 4 days' stay in Birmingham, from March 13 to 17. One day will be spent in Chattanooga, Tenn. The trip from Chicago to Birmingham and return will be made on a special train, over the Queen & Crescent route, and the round trip fare will be \$26.90. There has been some talk of including the ladies on this trip, but no decision has been reached as yet.

Progress Made in the Manufacturing Industries

Compressed Air Reservoir Made from Pipe.

The idea of using a number of lengths of pipe joined together to constitute a compressed-air storage reservoir is a good one, and can be employed for temporary requirements in a great many cases. In this instance Universal pipe, made by the Central Foundry Co. of New York, was used, which is best for the purpose, on account of the method of joining the pipes, which is so much more readily done than with ordinary pipe connections.

An 8-in. well, 220 ft. deep, had been cased all the way down and screened. Quicksand got in, however, and blocked up the whole well, which had to be blown out with com-

COMPRESSED AIR RESERVOIRS MADE FROM PIPE.

pressed air. The owners tried to get a tank suitable for holding air under considerable pressure, but could not get one without a great delay. Finally they hit upon the idea of hooking up pipe as shown, and using that as storage capacity sufficient to regulate the pressure while pumping out.

They used 39 lengths, 6 ft. long by 6 ins. in diameter. This gave in all approximately 50 cu. ft. of storage capacity. Two T's and four 90° bends were sufficient to put it together. The pipe was already on hand and was afterwards used for general purposes.

The Jackson Flexible Tool Holder.

The Jackson tool holder is designed to carry in suspension all portable tools, thereby increasing their utility and range of operation. It facilitates the use of pneumatic riveters, chippers, busters, blacksmithing tools, jack hammers, drills, tamping tools; electric grinders, drills, coal cutters, etc. By using the tool holder, the workman is entirely relieved

of the weight and shock of the tool, and his energy may be directed to guiding the tool to its work, thus allowing one man to replace several, and maintain continuous operation without fatigue.

The holder is quickly adjusted by the workman to suit conditions, and when the arm is fully extended as shown in the accompanying illustration, it has an operating range of 16 ft.

Portable tools, weighing from 20 to 150 lbs., can be

THE JACKSON FLEXIBLE TOOL HOLDER.

used to equal advantage with the standard type "E" holder, which is constructed to withstand the most severe usage above and below ground. It is mounted on either tripod or adjustable truck as standard equipment.

The inventor of this device is George W. Jackson, who is well known as one of the most able tunnel experts in the country. It will be marketed by Jackson, Schmitz & Shanks, 1117 S. Desplaines street, Chicago.

TRADE PUBLICATIONS.

Welch Hoisting Engine Controller. Welch, P. O. Box No. 2, Denver, Colo. Booklet; pp. 16; illustrated.

Many illustrations are contained in the booklet showing both the controller and installed hoists in connection with which the controller is being used. Line drawings of the controller and installations show clearly the way in which it operates and is constructed and placed in connection with the hoist. Other than this the booklet contains a list of companies using the company's controller.

Steam Condensing Plants, Barometric Type. Ingersoll-Rand Co., New York. Form No. 9024; pp. 31; illustrated.

In the first 10 pages there is a general talk on different types and methods of operating for steam condensing plants such as counter-current condensers, barometric condensers, jet condensers, etc. A more detailed account of the Beyer counter-current plant follows this. This system operates on a dry system; the cooling water is automatically removed and the vacuum and water pumps are operated by separate prime movers. Several types of the company's vacuum pumps for use in this service are separately and briefly described.

Sullivan Air Feed Stopping Drills, DF-21, DA-21 and DG-21. Sullivan Machinery Co., Chicago. Bulletin 66 G; pp. 11; illustrated.

The bulletin describes air-feed stopping drills intended for use in raising and stopping where the holes point upward and the cuttings run from the hole by gravity. It is interesting but marred by exaggerations, an example of which is

the statement that "Sullivan stopers have been tested in all parts of the United States, Canada and Mexico, under a wide variety of conditions and in direct competition with nearly every other stope drill manufactured. The results of these tests have been uniformly favorable to the Sullivan drill." The best that can be said of this assertion is the Scotch verdict, "Not Proven."

Power Transmission Equipment. Medart Patent Pulley Co., St. Louis, Mo. Catalogue; pp. 38; illustrated.

The catalogue has been gotten up, not to consider the entire line handled by the company, but rather to give a general idea. Separate catalogues are published which deal with each separate line more in detail. Equipment for every kind of power transmission is included in the company's line and among things here considered are sheave-wheels for the hoist; idler wheels for the rope from the drum hoist to the sheave on the head frame; countershafting, pulleys, hangers and sundry equipment for the same of use in transmitting power about the shop, plants, mill and smelter; rope drive equipment, etc.

Halby Shovelling Machine. Lake Shore Engine Works, Marquette, Mich. Folders and Pamphlet; illustrated.

A sufficient number of views and drawings of the machine and places where it is in operation have been included, so that description of things other than what it has done and can do are not necessary. The shovelling apparatus is mounted on a special car and can be moved any place on the haulage tracks underground. For motive power either compressed air, electricity or a gasoline motor can be used. One man with four levers controls the machine, which picks up the dirt much the same as a man with a shovel. The dirt is carried by means of a short belt to the rear where a tram car is located and there discharged. The shovelling arm can be revolved in a manner somewhat similar to a steam shovel's boom.

INDUSTRIAL AND TRADE NOTES.

The Terry Steam Turbine Co., of Hartford, Conn., announces the appointment of Stephenson & Nichols, Monadnock building, San Francisco, as its representatives in northern and central California and the northern part of Nevada.

Through the error of one of our field correspondents, the grinding mills of the Nevada Packard Mines Co., recently illustrated in this paper, were designated as Marcy. We are now advised by the company that these tube mills, one of which has been converted into a ball mill, were manufactured by the Power & Mining Machinery Co. They are driven through Morse silent chain from Westinghouse motors.

N. B. Ford, who for 10 years traveled for the Corbin Screw Corporation from their Chicago office, having his headquarters in Kansas City, and who left some 2 years ago to become connected with the Ford Chain Block & Mfg. Co., of Philadelphia, has re-entered the employ of the Corbin Screw Corporation, as salesman, with headquarters in New Britain, and covering the territory formerly traveled by A. H. Harrop.

The entire business of the Minerals Separation American Syndicate (1913) Ltd., a British corporation, has been taken over, as from Dec. 7, 1916, by Minerals Separation North American Corporation, an American company, organized under the laws of the state of Maryland. Messrs. Beer, Sondheimer & Co., 61 Broadway, New York, will be general agents, not sole agents. Edward H. Nutter, 825 Merchants' Exchange building, San Francisco, is chief engineer for and on behalf of the new corporation.

The Denver Rock Drill Manufacturing Co. of Utah has been incorporated with offices at 115 West Second South street, Salt Lake City, and with officers and directors as follows: W. H. Leonard, Denver, Colorado, president; R.

A. Scott, Salt Lake City, vice-president and general manager; J. R. Elmendorf, O. D. Lindstrom, and F. B. Matheson. The company is a subsidiary of the Denver Rock Drill Manufacturing Co. of Delaware. Its incorporation in Utah is for the purpose of arranging affairs so that western business can be taken care of more advantageously, and the company will give special attention to the territory embracing Utah, eastern Nevada, southern Idaho, and Montana. During the past year the business of the present company has been exceedingly gratifying.

NEW PUBLICATIONS.

Mine Ventilation Stoppings. By R. Y. Williams. Washington, D. C., U. S. Bureau of Mines. Bulletin 99; pp 30; illustrated.

This bulletin has been compiled with special reference to Illinois coal mines. The first cost of several types of ventilation stoppings is discussed as well as the annual cost of maintaining the stopping during its period of service. It furnishes a basis for comparison of efficiency of the different types as well as data for the engineer in planning the development of a mine.

The Mines Handbook and Copper Handbook. By Walter Harvey Weed. Vol. XII. 1916. Published by the Stevens Copper Handbook Co., 29 Broadway, New York. For sale by Mining World Co., \$10.

A study of Vol. XII, the current edition, shows that the name has been changed to the Mines Handbook and Copper Handbook and the work enlarged to cover all the more important North American mining companies producing gold, silver, copper, lead, zinc, tungsten, bismuth, antimony and tin, in other words all metals save iron.

Although the descriptions of foreign properties have been omitted, owing to the war and also lack of space, the volume has 11 chapters compared with 5 in the previous issue. Chapter I, Glossary of Mining Terms and Chapter II, Mineralogy, The Important Ore Minerals, will be especially valuable to readers unversed in technical and mining terms. Chapter III, a Description of All Known Copper Bearing Minerals, is the only complete list of copper minerals published. Chapter IV, has 1162 pages of detailed descriptions of mines in the United States, Canada and Mexico, including amount and location of holdings, finances, profit and loss, geology, nature of ore, output, methods of mining, milling and smelting, probable future, successful or otherwise. Chapter V, the Metal Mining Industry, is particularly interesting as it gives the occurrence, demand for and uses of the different metals, together with production and prices for years back. Chapter VI, A Resume of the Copper Industry, covers this field in a most thorough manner. Chapter VII gives a table of Dividend Paying Companies, also a table of mining stocks listed on the New York Stock Exchange and on the Curb. Chapter VIII includes Data of the World's Principal Mines and a tabular comparison of operations and costs of the "Porphyry Coppers." Chapter IX, List of Obsolete Securities of Dead, Merged, Liquidated or Bankrupt Mining Companies, with references to former volumes in which they are described. A striking innovation is a list of several thousand mining company officials in Chapter X, including the name and address of a large number of men connected with the mining industry of North America. The geographical index, Chapter XI, includes the names of the properties described in the book arranged by states, districts or towns for handy reference.

The mine descriptions proper have been more conveniently arranged than heretofore. Black face type has been used to denote the address, capitalization, property, geology, equipment, etc., in each company description. Tabulating has been used freely; this is of especial advantage when making comparisons of operating statement and yearly production.

The vast amount of new data contained in the Handbook has made the work far more valuable to the mining world.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Fairbanks.

On Chatham creek, an old producer which is a tributary of Cleary creek, Frank Brandham and Fred Thompson, have uncovered gravel which runs as high as \$17 per sq. ft. of bed rock. The discovery of the pay was made on No. 2 Chatham. Thompson & Brandham used a hand drill in their prospecting. It is from results obtained from the drill hole that the value of the ground has been figured. It is 12 ft. to bedrock there and the ground has been prospected before, but with poor results. One reason for this was that the ground is wet, and it was therefore nearly impossible to get a shaft to bedrock.

The Hughes-Timmins-Lewis dredging interests in the Tatlamka have been managed during the season by W. G. Jack, mining engineer. Jack has left the north for the winter. Before leaving he secured options on most of the claims on Goldstream between No. 11 and No. 24. On the majority of the claims very little work has been done. Most of the owners have considered the combined properties an ideal proposition, and have been waiting to get dredge men interested.

Falcon Joslin has left for New York to interest capital in some of his developments. Before leaving he secured options on several more of the quartz properties in the gold belt on Ester, Dome, in addition to the options he secured on the Tyndall, Finn & McLaughlin and Smith & Meylone properties. Some of his new options are on properties owned by J. C. Kinney, Carl Franklin, McLaughlin and O'Laughlin. An expert engineer is now making an examination of the properties, the results of which have not been made public yet.

ARIZONA.

Jerome.

Phillip Carroll, of Hancock, Mich., was elected president of the Decatur Copper Co., at a meeting of the directors held in Decatur, Ill., last week. Mr. Carroll has the necessary executive experience and the financial backing to make the most of the company's mineral resources. The property is most favorably situated, and work will be done at once to follow up the recent finds of the Green Monster. The secretary is Samuel Morthland, of Decatur.

Among the companies having holdings in the district is the Michigan-Verde Copper Co., one of a number of recent incorporations. It consists of 310 acres, divided into three lots, all of which are unusually attractive as mining propositions. Two of these lots, one of 90 and the other of 40 acres, are located in the immediate vicinity of the famous "glory hole" from which the United Verde has extracted millions. One of the lots is within 1500 ft. of the glory hole. Miners in the employ of the United Verde assert that they are working in ore in the west drives of the United Verde mine within a few hundred feet of the Michigan-Verde line. These miners believe the ore bodies of the United Verde extend into Michigan-Verde ground, and are backing their belief by purchasing Michigan-Verde shares. Plans are now being made for the development of that portion of the Michigan-Verde adjacent to the rich ore exposed in the west slopes of the United Verde.

Oatman.

Among the numerous prospective mines of Oatman which are being vigorously developed interest just now centers on

the Crescent, Nellie and Adams in the Black Range section and the Ivanhoe, which lies between the Times mine and the Crown City property of the Tom Reed Gold Mines Co., all of which have reached interesting points in their underground workings.

The Nellie mine has entered the vein in the shaft at 375 ft. and proposes to continue sinking, passing through the vein and to the 500 level where a crosscut will be driven to cut the vein again. On the 350 level considerable drifting was done and some good ore encountered but it was not uniform. It is the belief that a depth of 500 will disclose a body of good ore and it is the plan of development to drive a drift to the east where three veins appear to form a junction.

At the Crescent the tunnel has cut the vein 640 ft. from the portal, disclosing 3 ft. of quartz showing the chloritic greenstone characteristic of the Black range. A drift will be extended southeast toward a known shoot.

The Adams shaft was sunk to a depth of 425 ft. and a station cut at the 400 level from which a crosscut is to be driven to the vein, which should be cut within 50 ft. The company is now installing an 80 hp. engine and large pumps and making provision to handle a heavy flow of water which is expected. The Adams has a good surface showing and the acquisition of the property was recommended by C. H. Palmer Jr., upon whose report Frank Keith, Seeley W. Mudd and associates undertook the development of the United Eastern mines. E. H. Newlands of Los Angeles is president of the Adams Mining Co. and N. A. D'Arcy, a Nevada mining man, is manager. These two and Palmer form the board of directors.

Work has been resumed at the Murdock, which is north-east of the Black Range section and on one of the main dikes. The Murdock has some rich ore on surface and has a good outlay of machinery. It is under the management of S. S. Porter, for many years superintendent of the Gold Road mines.

The Arizona Rex mine has replaced the hoist that was removed from the main shaft and resumed work. This property is cornered with the United Eastern mine on the north-east and is controlled by Frank Keith, Seeley Mudd and associates of the United Eastern.

Horace V. Winchell, mining engineer, spent the week examining the Big Jim and Ivanhoe mines, these properties being under the same management. The Ivanhoe recently cut a promising vein on the 500 level after passing through a fault and is now drifting in ore on the hanging wall of the big dike.

At the Big Jim preparations are being made to resume sinking from the 500 level and by the time the proposed 400-ton mill is under construction, two or more levels will have been opened below the 500. Superintendent Keating places the tonnage already developed on and above the 500 level at 250,000 of an average value of \$12 to \$15. He estimates mine and mill costs at under \$5 per ton. It will take 2 or 3 months to complete the mill plans and actual construction of the mill will not commence until spring.

While the exact date on which the United Eastern mill is to start has not been definitely decided, it will be some time before Christmas. Practically all the construction work has been completed and everything is about in readiness to start the machinery. The No. 2 3-compartment shaft has been fitted with ore pockets on the 4th, 5th and 6th levels, an electric flashlight signal system installed and electric lights strung along the crosscut which connects with the vein. This work having been finished and everything put in readiness for stopping, shaft sinking has been resumed in No. 2, which is down 60 ft. below the 665 level. According to the dip of

the vein on the levels above the shaft should cut the hanging wall at about 950. Developed ore between the 300 and 665 levels is estimated at 200,000 tons valued at \$5,000,000. All of this has been opened since March, 1915. The vein is 25 to 50 wide and with the exception of an occasional "horse" of country rock it is solid ore throughout. Some good ore has been encountered in the drifts and crosscuts and the vein on the 400 level averaged \$22.93 across 25 ft. The mill will have a capacity of 200 tons and is expected to make an extraction of 97% at a cost of less than \$2 per ton. Active preparations are being made for the construction of a mill at the Gold Ore mine near the Gold Road. For 3 months the Gold Ore milled its ore at the Gold Road mill. It is said that the average returns of the company were \$30 per ton. The money received from this source will be added to by subscription from several wealthy eastern stockholders and the mill will be built early in 1917.

Development work continues on the easterly end of the Tom Reed properties and a large body of good ore has been opened through the Aztec shaft at a depth of 500. What relation the vein bears to the Big Jim has not been established but in dimensions and structure it bears a strong resemblance, both veins having an average width of 30 ft. The Aztec ore shoot is said to average \$50 per ton for some distance in one of the drifts. E. W. Rabh, superintendent of the Tom Reed mine, is placing orders for a new unit to the mill which will increase the capacity from 175 to 350 tons. He expects to have this unit finished and in operation in 6 months.

The success of the Big Jim, United Eastern, Tom Reed, Gold Ore, and other companies has brought about renewed activity throughout the district and there are now between 40 and 50 properties operating besides those doing assessment work.

Chloride.

The Rattlesnake mine has picked up the ore in a short crosscut run from the bottom of the new shaft. An average of 2 ft. at that point yields returns of \$99.20 per ton. Much copper is showing in the ore.

The Schenectady has broken into very rich silver ore in the North drift, 175-ft. level. Much wire silver and rich specimens are obtainable, exciting great interest, as proving old Chloriders did not go deep enough.

The Hidden Treasure tunnel ought soon to cut vein. Much water is coming in at face and formation changing.

Elkhart expected to start up in a few days. Mill is to be remodelled and active campaign mine development pursued.

Tennessee has completed raise from 1400 to 1170, making good air on lower levels. Men are being put to work as fast as found. The winze was started on 1400 level, 130 ft. from shaft; much copper is coming in.

The Copper Age just broke ground for new mill. The company is well financed and progressive. Mine development has exposed large ore reserves of splendid quality.

Globe.

At Inspiration Con. a pipe line is being constructed on pontoon bridges, across the tailings dam. It will connect the mill with the power house and furnish hot water at the mill during the winter. This is being done because it has been found that the temperature of the mass passing through the flotation machines has considerable influence on the efficiency of the machines. The hot water used will be that coming from the condensers which serve the steam engines. This water when it leaves the condensers ordinarily has a temperature of about 120° F., and under present conditions has to be pumped up to the cooling pond and forced through the spray nozzles for cooling before being returned to the condensers. Under the new arrangement part of the cold water from the Kiser pumping station will be diverted from its passage to the mill for use at the power house, instead of making use of the partially cooled water from the cooling ponds. Thus the scheme is doubly effective, the power plant requiring cold water, and the mill warm water.

At the mill just west of the machine shop, the erection of two steel tanks is progressing. These are to contain fuel

oil which will be used in generating steam in a boiler plant located at the foot of the mill and used for raising the temperature of the concentrate mass fed to the Oliver filters. It has been demonstrated that if this material is allowed to become too cold the filters are not so efficient.

CALIFORNIA.

Atolia.

Atolia Mining Co., San Francisco, is mining and concentrating 60 to 70 tons per day of scheelite ore. The mill product runs about 60% NO_3 . This year's shipments of concentrates and high-grade ore will reach about 2500 tons. The mill being operated is a new plant, containing a crusher, a Marcy and four Huntington mills, and Vanners and Deister tables. E. C. Voorheis is president, J. H. Mackenzie, manager.

Grass Valley.

The Grass Valley Boundary Mines Co. has been formed by M. J. Brock and associates to work the Oak Tree, Cabin Flat and New Idea claims, located near the Peabody mine of the Golden Center Co. Arrangements have been made to expend approximately \$10,000 on preliminary development of the Oak Tree ledge, an ore body that has yielded much rich quartz.

The Grass Valley Con. Co., operating the Allison Ranch mine, has acquired for \$50,000 the adjacent territory owned by the Henderson and Lewis interests. The area comprises 53 acres, and is believed to contain the apex of the Caribou vein and other important ledges. Unwatering of the Allison Ranch mine is rapidly nearing completion, and arrangements have been made to resume mining on Dec. 25. All mine equipment is in position, and construction of the mill is proceeding rapidly.

At the Empire, now the leading gold-quartz producer of California, much new work is in progress. Large areas of new productive territory have been opened recently from the 4600 level, and a heavy tonnage is going to the 60-stamp mill from this portion of the property. At the Pennsylvania mine the company is keeping 20 stamps dropping on good ore. It is conservatively estimated the company is producing fully \$125,000 per month.

Jamestown.

The Sierra Nevada Exploration Co. has installed two pumps and a hoist at its Turner Flat placer mine, 3 miles southwest of Jamestown, and is constructing an electric transmission line. Several shafts are being sunk to tap the old river channels under Table mountain, and drifts will be extended into the gravel at a depth of 90 ft.

Amador City.

Foundations for mine and mill machinery have been completed at the South Keystone, and construction of buildings is making good progress. The extensive plant formerly in use at the Amador Queen mine has been moved to the South Keystone, and will be operated near the North Star shaft. Unwatering of the shaft will be rushed and work started from the 600 level with a view to opening several promising veins.

Within 2 weeks the management of the Keystone expects to resume mining on a normal scale. Retimbering of the shaft has advanced to the 400 level, and at all the important stations concrete floors have been put in, and ore-handling facilities greatly improved. C. R. Downs, of Sutter Creek, is manager.

Oroville.

The Oro Electric Corporation has placed orders for the building of a gold dredge of 6 cu. ft. capacity. It will operate on a 100-acre tract at Thermalito, near the valuable producing properties of Natomas Con. It will go into commission in the early spring.

Carrville.

The J. F. Nader property, containing 60 acres of dredging ground on Coffee creek, has been taken under bond by E. A. Wiltsee, understood to represent eastern capital. The same people are reported to be negotiating for the Nash

deep-gravel mine, one of the largest placer properties in Trinity county.

Construction of the massive gold dredge of the Pacific Dredging Co., a subsidiary of the Yukon Gold Co., has been completed, and the dredge will go into commission within a few days. The company is prospecting large areas of promising ground adjoining the developed holdings, and plans the building of a second large gold boat, according to report.

Kennett.

Despite inclement weather the Mammoth Copper Co. is rapidly completing the \$100,000 electrolytic zinc plant at this place, and it is believed everything will be in shape for commencement of production in February. The plant embraces the process developed by the Bully Hill Smelting Co. after over 5 years of experiments, and will operate on ore from the Bully Hill district and the fine dust from the Mammoth baghouse, which contains considerable zinc, together with gold, silver and copper.

Sutter Creek.

An ore body ranging from 5 to 15 ft. in width has been opened on the 2600 level of the Oneida mine, controlled by the South Eureka Co. It has been developed for over 100 ft. and is of good milling character. The Oneida is provided with a 20-stamp mill, hoist and compressor, and is connected with the South Eureka at the 1800-ft level.

Nevada City.

The Mohegan property at Gold Flat has been taken under bond by A. J. Burke, who will operate it in conjunction with J. C. Campbell. The hoisting and pumping plant formerly in service at the Mt. Auburn mine has been moved to the Mohegan and electric power secured by the building of a transmission line from the Pittsburg property. The shaft will be deepened and drifts extended to seek extensions of veins which formerly yielded good ore.

The Champion Mines Co., controlled by the North Star Mines Co., is hoisting a heavy tonnage of good ore through the Providence shaft, which has been converted into the main working outlet. Preparations are being made to place more stamps in commission, and to prosecute extensive work from the deep levels of the Providence shaft. In addition to the ore going to the mill, considerable sulphurets are being shipped to the Selby smelter.

Iowa Hill.

Colfax people are busily completing arrangements for extensive work at the Golden Streak mine, a large gravel property. Considerable equipment has been installed at the property, which will be worked by the drift method. A number of gravel claims are being worked in this vicinity with good results. A company of Chinese capitalists has taken a 3-year lease on the Rose and Schwab canyons, containing tailings from the once-famous Morning Star, Big Dipper and Jupiter mines, and is preparing for extensive work.

COLORADO.

Cripple Creek.

The November production of this district amounted to 75,623 tons, with an average value of \$16.54, according to mill reports. The gross bullion was \$1,251,356, and is divided as follows:

	Tons.	Value ton.	Gross value.
Golden Cycle	38,000	\$19.00	\$ 722,000
Portland	11,333	19.85	233,969
Smelters, Denver and Pueblo..	4,550	55.00	250,250
Portland, Crip. Ck.....	18,700	2.51	45,937
Isabella Mines	2,640	3.00	7,920
Worcester-Rubie	400	3.20	1,280
Total.....	55,623	\$16.54	\$1,251,356

Steamboat Springs.

The Royal Flush mine, owned by the Hahn's Peak Gold M. & M. Co., has made a strike of gold and silver ore in

three levels tributary to the raise which connects the lower and upper tunnels. Ore has been found in the 400, 460 and 476 levels. Three classes of ore are being mined, namely: first class smelter ore, second class smelter ore, and mill ore. The first class will run \$100, the second class \$50, and the mill ore \$18. The smelter ore is being sacked for shipment to the Globe smelter, Denver, while the mill ore is being conserved for treatment in the company concentrator at the mine. From here concentrates will be shipped to the Globe smelter. Connection between the 400 level and the old winze is being made. When this is completed mill ore from the upper levels will be passed through the old winze, trammed through the 400, dropped through the raise to the lower tunnel, and taken to the mill. At present 300 sacks of smelting ore have been mined from rich stopes, and mining and sacking is still in progress.

Leadville.

A contract has been let to Don McKay and work started in the Ontario tunnel in the Tiger and Green Mountain mines. The Ontario has been taken under lease by local men who have advanced the breast of the main tunnel 200 ft. They plan on doing extensive development in the property. The new contract calls for the driving of the tunnel another 275 ft., a distance which is expected to put the breast in ore.

Though extensive development is being carried on in the several mines of the Down Town section, aside from the large body of iron-manganese recently uncovered no important discoveries have been made. At present an output of 40 tons daily is being shipped from the Penrose. The flow of water in the property continues strong and the pumps are forced to operate to capacity. Lessees on the Hibsche are driving prospecting drifts in search of the bodies supposed to exist. Some of the old workings are being cleaned out and retimbered.

Telluride.

In the recent annual report of the Tomboy Gold Mines Co. the accounts show a profit of £76,923 16s 11d, which with the carry forward from the last balance sheet, £20,778 7s 4d, has placed at the company's disposal £97,702 4s 3d. During the year the company treated 150,488 tons of ore, which is the largest ever passed through the mill. The average yield was \$7.14 per ton against \$7.05 last year, but this increase has been offset by an increase in costs of 30 cents per ton. In the Argentine section of the property exploration work will not be continued, at least at present. The lower levels of this section contain a large tonnage of ores carrying lead, zinc and copper. In the Montana section practically the whole work of the year has been carried out. About 5159 ft. of development work was accomplished in drifts, raises and crosscuts.

Kokomo.

Recently the Michigan Mining & Milling Co. has installed a No. 10 Imperial type Ingersoll-Rand compressor and several jack-hammer drills. Its main tunnel is in 750 ft. The company is shipping 50 tons per day to the Globe smelter, Denver and an average of 2 cars of lead ore to the Leadville smelter. The ore shipped to Denver is an iron sulphide carrying gold and silver.

The tunnel on the Tucker mountain property, which has been retimbered and tracks laid, has reached the ore. The body is 6 to 7 ft. wide, carrying gold, silver and copper. Among other current producers here are the Robinson, Champion, Felicia, Grace, Wilfley and Colonel Sellers.

Boulder.

The Nil Desperandum is under the supervision of Mgr. Brandt. In the 2nd level the greater part of the work has been done. There is an ore body there 15 ft. wide and 50 ft. long which is being broken down and shipped with but little sorting. In association with this body a streak of telluride from 2 to 4 ins. wide is carefully mined and conserved. It carries from 15 to 30 ozs. gold. A steady output of ore is to be maintained. The second level is to be made the main working level of the mine by extending the level east a short distance to surface. Mine buildings, shops and ore houses will be erected at that point and the lower levels operated from that station. A force is engaged driving the 3rd level east to undercut the old workings which have been

mined out to the 2nd level. This 3rd level will give 100 ft. of stoping ground on an ore body that was a producer of high grade some years ago.

Idaho Springs.

At the Edgar, the operators have drifted in 1100 ft. and are stoping 180 ft. up from the tunnel level.

They have let a lease to Walde & Co. to drive 1500 ft. east from the present workings in the Edgar on the Edgar No. 2 extension of the Edgar. They have a good streak of ore in the breast of the drift, and soon expect to cut the same vein from which the Roy lease extracted a tonnage of high grade. The new operators expect to soon start a raise in the Edgar No. 2. They have 1000 ft. of virgin ground to work to the surface, if the Edgar No. 2 shows up as well as did the Edgar.

IDAHO.

Wallace.

The Consolidated Interstate-Callahan Mining Co., which is controlled by the American Metals Co., is the third largest zinc producing corporation in the world, and it probably will assume even better rank in the next year, as the extensive development under way is more than counterbalancing output from the property. Official reports state that there is more than 5 years' ore supply in reserve at the prevailing rate of production, about 6800 tons monthly of crude lead and zinc ore and lead and zinc concentrates. Plans have been prepared for a 1200-ton mill at Enaville, where a site was purchased a number of months ago, but it is probable that construction will not begin for another year, as it is estimated that there is enough ore in the upper workings of the property on the Nine-Mile side to keep the present plant operating for 3 or 4 years. Several months ago the company acquired the Amazon-Manhattan group on Beaver creek, and the workings of the two properties have been connected by the main working shaft, which has been extended to the No. 3 tunnel of the Amazon-Manhattan. This affords an outlet on the Beaver creek side, and the new branch being constructed up Beaver creek by the O. W. R. & N. from its Murray branch will run within less than a mile of the tunnel portal. The product of the property now is shipped from Sunset station on the Nine-Mile branch of the Northern Pacific railway, the mill and shipping bins being connected with a 10,000-ft. aerial tramway.

Through a defaulted board bill for \$40, Elsie Heller of New York a number of years ago secured possession of the Four S group of lead-silver claims in the Yreka district. This investment has increased to \$30,000, George H. Heller, manager of the Elsie Heller estate, having bonded the property for the latter amount to Edward S. Crane of Spokane, the payments extending over a period of 2 years. The group adjoins the Liston, Polaris and Yankee holdings, regarded as among the most promising partly developed groups in the district, and Crane plans to install a compressor plant and let a contract for 200 ft. of tunneling. The ore already exposed carries a high percentage of silver, and 100 sacks shipped in 1899 are said to have yielded the largest silver values of any ever sent out from the Evolution and Yreka districts.

Under terms of an agreement recorded at Wallace, the Horst-Powell Copper Mining Co. takes over the control and operation of its property, held under option by the Empire Copper Co., of which Alfred Page and Andrew Devlin are heavy stockholders. The original option on the property was given to Alfred Page in November, 1914, and was subsequently assigned to the Empire Copper Co. The property consists of five lode claims, millsite and water right located on the Little North Fork river, about 15 miles from Enaville. For the last 2 years the property has been under steady development, and the mill has been constructed and put into operation during last summer. It is recited in the agreement that the Empire Copper Co. in developing and equipping the property has become indebted \$75,000, and is unable to meet its obligations. Under the agreement the option of November, 1914, is extended for 2 years, and the Horst-

Powell Co. waives its rights to royalties under option. The Empire Copper Co. turns over the property and the mill to the Horst-Powell Co., which will operate the mine, and it agrees to collect all money due and to pay all operating expenses, and pay over to the Empire Copper Co. 90% of the net profits of \$75,000 to liquidate the present outstanding indebtedness. It is stipulated that the Horst-Powell Co. does not assume any responsibility for debts of the Empire Co., and that if the option is not exercised on Jan. 2, 1919, the Empire Co. waives all right to remove any machinery, equipment or mill from the property, and that title shall pass to the Horst-Powell Co.

In a report to stockholders of the Highland-Surprise Mining Co., P. F. Rogers, general manager, intimates that there is a reasonable belief that the corporation soon will be paying dividends. Conditions at the property are better than ever before, and a revision of the smelter contract has been secured that will add between \$3 and \$5 a ton to the net value of the concentrates. During the last year the company has enlarged and improved the mill at considerable expense and development in the mine has blocked out about 160,000 tons of ore. Besides this block in the Highland Chief, there is another block in the Surprise, the extent of which has not been determined. During the last month changes in the flotation plant were made by T. Owens, general mill superintendent of the Federal Mining & Smelting Co. When the changes were completed it showed a considerable increase in recovery.

Murray.

At the annual meeting of the stockholders of the Murray Hill Mining Co. in Spokane it was decided to begin sinking a 2-compartment shaft as soon as the supply of water for power is available, according to President C. E. Mallette. The shaft will be sunk at a point about 1200 ft. from the portal of the tunnel and at a depth of 750 ft. It will start on an ore shoot about 3½ ft. wide and which has been proven for a distance of 70 or 80 ft. The ore is of excellent milling grade, yielding a zinc concentrate, it is said, of from 49 to 52%. The company has a mill and water power for all purposes, and is altogether well equipped for operation. The following officers were re-elected: C. E. Mallette, Spokane, president; J. C. Feehan, Murray, vice-president; C. C. Tenny, Spokane, secretary.

Owing to the shortage of water and other difficulties in handling the ore, the Golden Chest mine has suspended operations for the winter. The Golden Chest came into prominence during the last year on account of the large amount of tungsten ore in connection with the gold, and considerable expense was incurred in changing the mill to recover both metals. While these changes were not as successful as was anticipated, they demonstrated the practicability of the system. In the meantime the price of tungsten has dropped from the high level of a year ago to about \$17 a unit. At this figure it is still a very valuable factor in the Golden Chest ore, and it is reported that the owner of the property, Vivian Green of New York, is now considering the construction of a new mill with the view to a close recovery of both the gold and tungsten.

LAKE SUPERIOR.

COPPER.

Houghton.

About 17,000 employes will participate in a bonus distribution on Jan. 1. This bonus was announced last summer. It is the additional premium, over the regular increase in wages, of 25 cts. for every employe who works July 1 to Jan. 1 steadily. It is expected that the same or a larger bonus will be announced for the first half of 1917.

Copper Range will at each of its mines make a larger production than that of last year, when Champion had 33,407,599 lbs., and Baltic 12,028,947, and Trimountain 8,302,896.

Hancock's own shaft No. 2 has been examined from top to bottom, which is a very few feet short of 4000 ft. deep. All five veins were visited. All the lodes Nos. 2, 3, 4, 8 and 9, were found to be well opened in length, and though some

of them are only 4 and 5 ft. wide, they all carry the rock in profitable values. The No. 4 lode is narrow, but the copper is almost sure to be there; No. 8, the Pewabic or Quincy, is really the best, and barrel work was seen sticking out of the sides of the drifts and the stopes everywhere. The rock has run somewhat low in grade at times owing to so much new work; costs have been high because of so much dead work in the way of crosscuts. With the present abundant supply of men Manager J. L. Harris will rapidly increase his production, as he has everything underground ready; the ground opened up ahead is sufficient if no further new work should be done for some time; a winze from the 44th level down to the 49th has been completed, and another from the 49th to the 53d is almost completed, the two to be used for chutes for rock and for man-way, so that intermediate and sub-levels can be opened; and a connection at the bottom with the Quincy shaft No. 7 and other openings has been made, so that a lively current of air is constant and the company's richer ground on the Pewabic is being steadily prepared for stoping. Pres. J. D. Cuddahy says the company is now out of debt and that the earnings are at the rate of \$6 annually.

Michigan is meeting with good grades of copper in all three of its lodes. On the Evergreen $1\frac{1}{4}$ tons of mass and the usual amount of stamp values was taken out in the 26 ft. opened by drifts; the first 8 ft. were only fair, but the remainder with this heavy mass has high values, which are still being laid bare in the faces of the drifts. On the Ogimah, which has the reputation of carrying nothing but stamp varieties, a second bunch of mass in the 180 ft. covered is now being passed through. On the Butler in the western drift the diamond drill that has been seeking the good ground since it was lost about 3 weeks ago through a fault, was turned to the fault instead of away from it, and the good grades were encountered in a short time. In the eastern drift on the 5th level it is expected that the top of the raise made from the 6th level will be cut into at any time.

Cherokee has high grade in the shaft, which is 7 by 12 ft., being made purposely small so as to explore the lode with as little expense as possible and it found the width of its vein at the depth of 118 ft. by a crosscut to be 29 ft. with the first 10 ft. of good values, and some copper all the way in the rest. One drill in the eastern drift on the 118 level will be operated both shifts, and the other two will do the sinking. All the openings have averaged very high from the start.

LaSalle has very good grades so far in the drift on the 32nd level that is being extended from the Old Osceola, and that has a length of over 500 ft., about 200 ft. being made monthly. This means very much for this property even if it is at a great depth. A crosscut might be driven over from the Kearsarge lode at the bottom of LaSalle shaft No. 1 on the 21st level, to test its mineral contents, though the distance, 2200 ft., is quite long.

Isle Royale is in splendid condition at present, as it is so far ahead of its own and the available stamp service at the Centennial-Allouez mills that it has had to stop hoisting at one of its shafts in the past week because the rock could not be taken away. Drifting south of No. 7 shaft has been started, so as to get a tonnage ready here as soon as possible, to ascertain the grade of the copper, and if it is good, which there is every reason to believe it to be, to probably drive out the long drift that can be used some time in the future for raising when a new shaft is sunk. The foundations are all ready at No. 7 for the new wooden rockhouse which will be begun within 2 months.

Superior is sending to the Centennial-Allouez mill about 12 to 13 cars or 540 to 585 tons of rock daily, and about 14,500 tons monthly. Shaft No. 1 is bottomed at the 29th level and it is understood that considerable drifting is being done with not much success; but the mine has the advantage of having a few years reserves ahead, and there is at least an even chance of its finding other mineralized areas before this supply is exhausted.

Houghton is cutting out the good copper ground at the bottom level, the 12th, and is opening into an excellent quality of rock that will go far in spite of the great expense

of getting it to the surface towards paying for the disbursements being made for the present work at the mine.

New Baltic is now down about 65 ft. with its shaft, and the work is going rather slowly owing to quite a large quantity of water that is apparently coming up from the lode. The latter is thought to be very near, as a large piece of well mineralized amygdaloid was met with, and also from the presence of the water. The water is being pumped out after great delay now common in getting supplies.

Michigan Smelter which smelts and refines the copper of the Copper Range, Mohawk, Wolverine, Lake and Franklin, in October and November produced an output of 9,000,000 lbs. of refined copper; its normal is about 6,000,000 and the increase was due to the scrap copper that came from the manufacturing of Detroit to be smelted for commercial use. The output this month will be considerably smaller, as there is no scrap copper coming. Of course this resmelting is profitable business for the smelter.

IRON.

Iron Mountain.

Recently the Indiana stopped shipping for the season with a total of 45,000 tons. The mine will employ a considerable force throughout the winter. Some ore will be mined and much development work done. An electric haulage and pumping plant will be installed, the work to be done by company men under the direction of Supt. Richards.

The stock-pile steam shovel suspended operations at the Pewabic Dec. 6 and the last shipment from the mine was loaded at Escanaba on Dec. 7 which amounted to 34,000 tons. The total for the year was about 300,000 tons. A fairly large force will be kept to operate the mine through the winter.

The Dober mine at Iron River was unsuccessful in its attempt to do away with sulphur fumes by flooding the mine so as to extinguish the fire in the slate formation which is the source of the sulphur fumes in the mine. The mine, however, will not be abandoned, but General Supt. Davidson will try other methods to accomplish this end.

Ishpeming.

The Cleveland-Cliffs Iron Co. and Oliver Iron Mining Co. will adopt a 10% wage increase Dec. 15. This is the third increase in less than 2 years. All employes in the mining departments of these concerns will share in the increase, a total of nearly 4000 workmen. Other companies, including the Republic Iron & Steel Co., operating the Cambria and Hartford mine in Negaunee, announce a similar increase.

MISSOURI-KANSAS.

Joplin, Mo.

Zinc ore slumped during the past week, top grade ores to \$100 and seconds down to \$90, a cut of \$5 per ton on the former and \$10 per ton on seconds. Friday, however, after several days of weakness and lack of demand the market steadied and there is hope among producers that the coming week will see higher prices. Lead took a decided jump during the past week. Sales were reported as high as \$97 top basis, ranging down to \$87.

The Empire District Electrical Co. has replaced one of the two generators recently burned out, and is able to furnish about 60% of the normal demand to the Joplin district. They expect to complete the installation of an entire new set of machinery shortly, when there will be an adequate supply. The majority of mines which have been closed down on account of lack of electric current are now running one shift.

The C. S. & P. Mining Co., composed of O. E. and Harry Stephens and LeRoy Clayton of Joplin and W. T. Pennington of Wilmington, Del., is making fair sized turn-ins. The mine is located on an 18-acre lease of the Stephens land about 1 mile northwest of Four Corners. After a number of drill holes had been put down, with good findings, a shaft was started 2 months ago and has been completed to

a depth of about 123 ft. The property is just north of the old Abou Mine, which was a fine producer 20 years ago, and a big dividend payer when ore was bringing only an average of \$15 per ton.

The Baldry Mines on the E. Rose land south of Joplin have greatly augmented their output of silicate and lead by adding another working force. Two crews have been put to work at the No. 2 shaft, which recently was drained. One crew will go after the lead at the shallow level and the other after the silicate deeper down. At the No. 3 shaft two crews also have been put to work, but here both will work on the silicate.

The old Grand Haven mine at Midway, which will be known in the future as the Tonotwa property, has been taken over by Asquith and Berlin, who will open up the property. This formerly was a good producer, the ore body being worked at the 175 to 190 level. A total of seven drill holes have been put down by G. A. Shively on this property, four of them being particularly good.

Webb City, Mo.

The Red Bird Mine, south of Carterville, is producing 125 to 135 tons of concentrates per week, the mill being operated one shift only. Besides this the output of sludge is considerable. The Red Bird has a double compartment shaft, one of the largest in this field.

Two shafts are going down a short distance south of the Baltic and Onamena Mines at Duenweg and both are now in good ore. Although the shafts are only a short distance apart, they are being put down by different companies and on different leases and tracts. Wampler and Co. are putting down one on the Hackett land, and Shoemaker and Co. are putting down the one a short distance to the north, on the Norton tract. At the Wampler shaft good lead was encountered in addition to the blende.

The Coahuila Mining Co. has started up its No. 1 plant at Duenweg once more, after a shutdown since last Sept. The No. 3 plant, which was completed and placed in operation during the summer, has been going steadily with good production. It is one of the biggest plants in the district. Coahuila some time ago purchased a 40-acre lease to the northeast of the No. 1 mill, and drilling has been under way on it for some time.

Miami, Okla.

The Piokee Mining Co. has started the erection of a new 250-ton mill on its 80-acre tract $\frac{1}{4}$ mile east of the Picher properties at Picher, Okla. It is expected the new plant will be completed within 90 days and will cost about \$40,000.

Church & Wright have an 80-acre tract near the Blue Bird & Lennan, which is under development. A shaft is being sunk. Drill holes uncovered rich faces of ore which assayed as high as 32%. The ore lies in disseminated form. Also, east of the famous Welsh mines in the Century camp, these operators have a 210-acre tract which is under development. Four drill holes have been put down and showed ore that assayed 14.30% and higher. A shaft has been put down to the 135 level. A mill will be erected on this tract as soon as the ground is more thoroughly developed.

The Golden Rod Co. has 300 acres leased near Cardin and have purchased the Cramer concentrating plant at Cave Springs and moved it to a lease near Cardin. The mill is nearing completion and will be in the producing class soon.

Chas. Swartz has begun the construction of a 400-ton concentrating plant on a tract 1 mile east of Picher. The boilers have been installed and one derrick is up. The tract has been thoroughly drilled and the ore body proven.

The Rex Mining Co., which has leases on 105 acres at Cardin, has been making some good strikes, and will build a mill soon.

MONTANA.

Butte.

The stock of the Davis-Daly Copper Co. is traded in on the Boston stock exchange, the issue having been favorably passed upon by the governing board recently. For some

time Davis-Daly stock has been one of the leaders in the the trade on the Boston curb. It also is listed on the New York curb.

It is unofficially stated that the management of the North Butte Mining Co. has decided to sink a shaft in its east side property which is now being developed by the Northwestern tunnel, now in a distance of 600 ft. It is stated that the tunnel has been driven through well-mineralized ground and that the ore showing is such as to encourage the sinking of a shaft to a depth of 1500 to 2000 ft. for the further development of the property. The location of the shaft has not been decided on definitely. Last month the tunnel was driven 425 ft.

The East Side Mining Co., lessee of the Butte Bullwhacker property, has contracted with the Garfield smelter for the treatment daily of 100 tons of Bullwhacker ores. The agreement, it is understood, was consummated during the recent visit to Butte of E. L. Newhouse. It is stated that the leasing company during November earned net, above the amount paid the Bullwhacker Co. in royalties, approximately \$11,800. Including the royalties the net earnings for the month totaled about \$25,000.

Work of cutting through the new ore shoot recently disclosed in the Main Range mine of the Tuolumne Co. has been completed, showing the body to have a total width of 30 ft. Assays of 15 ft. of the vein returned 8% copper and 16 ozs. silver. The balance of the vein shows 4% copper and 6 ozs. silver. The ore bins at the Main Range mine have been filled while the shoot was being cut through and as a consequence new bins are being built. The management will install a 200-hp. electrical pump on the 700 level and two new boilers each of 175-hp. capacity have been purchased. These will give increased capacity for the steam line which runs from the Main Range to the Colusa-Leonard and both hoisting plants can be supplied with power from one central boiler plant.

The Great Butte Copper Co. has concluded the work of unwatering the Butte & Bacon shaft down to the 500 level and is installing a new electric pump. From the 250 level to the old station on the 500 the shaft was found to be filled with mud, rock and timbers. In order to reopen the shaft it was necessary to retimber portions of it, and at places piling had to be driven to hold the running ground. From the 500 level down, however, the shaft is apparently open, and as far as can be ascertained the timbering is in good shape. If it is possible the water will be bailed out, for which purpose a 300-gal. tank will be used. The Great Butte surface plant has been completed, although some little equipment for the sawmill and blacksmith shop is yet to arrive, being expected this week.

Missoula.

The Clinton district of Missoula county, with which two companies of Spokane investors have become identified recently, is the scene of a rich strike of bismuth ore running well in the metal. A report of the discovery has been made by Fred G. Bond, Missoula, who says: "The strike was made on the Senate group. The vein is 6 to 8 ft. wide and is composed of crystalline matter in banded form containing metallic bismuth. The dimensions of some of the larger cubes are $\frac{1}{4}$ by $\frac{1}{8}$ by $\frac{1}{16}$ of an inch. Ore was drifted on 45 ft. before discovery of the bismuth, it having been mistaken for lead-silver ore. The hanging wall is quartzite and the foot wall Butte granite. About 2 tons are on the dump. The apex of the vein is traceable 2000 ft.

Spokane operators who invaded the Clinton district recently are developing copper properties on which they report the exposures of highly promising conditions.

Troy.

E. M. Sander, an expert diamond drill man of Libby, left here for the Sylvanite mining district to take charge of the Jim Hill mine, a property of the Yakt Valley Mining & Milling Co., of which H. J. Ehlers is president and manager. A gold-bearing body of milling grade, said to be 45 ft. wide in the upper workings, is to be sought by a tunnel to be driven 1000 ft. A 200-hp. plant is to be installed on Fourth of July creek for the generation of electricity for mine operations and camp illumination. Among those behind the enterprise are V. D. Evans, of Fairview; V. R. Mitchell, of

Brockton, Mont., and L. G. Blanchet, of Grand Forks, N. D. The property is in northwestern Montana, near the Montana-Idaho line.

NEVADA.

Tonopah.

The Tonopah Mine Operators' Association has voluntarily increased the wages of all miners from \$1 per 8-hour shift to \$4.50. The same scale of advance applies to all workers, consequently machinists are receiving \$5.50 per day. The scale will remain in force while silver remains above 70 cts., and means the addition of \$22,500 to the local payroll. Tonopah operators are demonstrating their confidence in a still higher value for silver by their retention of huge stocks of the metal. The amount of silver held in storage by the Tonopah Mining and Tonopah Belmont companies is said to be fully 2,000,000 ozs., and several smaller companies are also awaiting higher prices.

The upward swing of the silver market, and the growing output of Tonopah properties lacking milling facilities, has generated a demand for the operation of more stamps. The Rescue Eula, Halifax, North Star and other properties are hampered by the inability of the active mills to take care of their maximum yields, and it is understood the Montana-Tonopah Co. has been encouraged to place its 40-stamp mill in commission. Much ore in the district formerly too low-grade to profitably work has now become remunerative as a result of the silver advance.

Goldfield.

The Red Hill Florence Mining Co. has been formed by local people to operate the Red Hill and Florence American mines, the latter formerly known as the Florence Extension. The group adjoins the Florence and Goldfield Con. properties and is believed to contain the main Florence vein and other valuable ore bodies. Orders have been placed for a 50-hp. electric hoist and large compressor and developments will be carried on from the 800-ft. Florence American shaft. The Red Hill property has been opened to a depth of 400 ft. and contains large bodies of good quartz. A. H. Howe, of the Goldfield Con. Co., has been chosen secretary.

Black sulphides, closely resembling the pay ores found in the Goldfield Con., Jumbo Extension and other mines east of the Columbia Mountain fault, have been encountered at a depth of 200 ft. in the third drill hole going down on the Silver Pick. Crosscutting from the 1100-ft. level is advancing rapidly east and west, with ore indications showing steady improvement.

It is reported the 50-ton flotation plant that has been operated on Laguna gold-copper ore by the Goldfield Con. will be devoted to treatment of ore from the Atlanta mine shortly after the 1000-ton plant goes into commission. Vast quantities of copper-gold ore have been blocked out in the Atlanta, particularly between the 1450 and 1750 levels. The Atlanta is controlled by the Wingfield interests, chief owners of the Goldfield Con. group.

Gardnerville.

New York people have taken the Ruby Hill copper mine under bond, and operations have begun under the management of R. C. Walker. The Ruby Hill has been extensively prospected with drills and shafts and contains large deposits of good ore. It is reported a plant may be erected in the spring.

Rawhide.

From the 600 level of the Nevada New Mines group a winze has been sunk 120 ft. and shows the ore body strongly defined and about 16 ins. wide. It has been followed all the way from surface and is proving the most persistent vein ever found in the camp. Gold and silver occur; 25 tons of ore are milled daily at the Black Eagle plant. Preparations are being made to increase the working force and a heavier output will be maintained next spring.

Elko.

The plant for production of gasoline from the extensive beds of shale near Elko has been completed, but the manage-

ment has decided to wait until the spring before starting operations. Crosscutting from the 100 level of the shaft is going forward in shale said to contain considerable paraffin. Manager Robert Catlin has returned to New York for the winter but experiments will continue in charge of T. J. Hoover.

Jarbidge.

George Wingfield has again entered the Jarbidge camp, and this time has secured the Elmore claims. This property is situated on the ridge between the Long Hike and the Bourne mines. A. L. Rinearson had been prospecting on these claims for the past 2 years and had found a good vein in place. Wingfield's engineer, J. O. Greenan, has been opening this vein and has several feet of ore that pans well in free gold. Wingfield has a corps of three engineers in camp examining several other properties.

The Tacoma interests have bonded several groups of claims and have let contracts for considerable tunnel work. On the Legitimate a compressor outfit has been installed to push the crosscut tunnel to the vein.

The Elkoro Mines Co. has recently been incorporated to take over the numerous interests of Shoup and Sloss holdings in the camp. This company has been operating over a year, and most of the claims which were bonded on one year's time have now been fully paid for and the company has started patent proceedings on 24 claims, including the Long Hike mine.

NEW MEXICO.

Lordsburg.

This district, which has long been considered a one-mine camp, is rapidly waking up. There is a good demand by the smelters for these silicious ores and though the market is practically closed to small shippers of base ores, the difficulty in getting ores out of Mexico has placed a premium upon these silicious ores which has stimulated the mining industry here.

The "85" mine is continuing to ship its usual 10,000 tons per month, mostly to the A. S. & R. smelter at El Paso, though the C. & A. smelter at Douglas, Ariz., has been getting several thousand tons per month of surplus output. Development work continues, they having reached the 570-ft. level with a winze from the 450-ft. level. A station is being cut and a raise will be run to connect with the main shaft. It is reported that the ore bodies show greater width as depth is attained.

Warner and Yates of Beloit, Wis., were here to attend the annual stockholders' meeting, there being but eight stockholders in this company. The dividend rate has been 2% per month on a capitalization of \$1,000,000.

The Bonney Mines, recently purchased by David J. Evans and W. T. McCaskey of Chicago, who have organized the Western Mining & Development Co., to handle this property, is shipping steadily. The ores are the richest produced in the camp and the property gives promise of making a big producer. While development has hardly started, they shipped last month seventeen 50-ton cars to the Copper Queen smelter at Douglas. The ores are high grade, the ore bodies from 4 to 8 ft. wide and very well defined. It is an ideal concentrating proposition and tests are now being run to establish the advisability of erecting a 100-ton daily capacity mill, in which oil flotation will be a feature. Equipment has been standardized after competitive tests by selecting the "Vaugh" stopers, drifters, pluggers and sharpening equipment. A rigid inspection has just been completed by the directors who have authorized extensive improvements to the equipment. James P. Porteus is general superintendent and Wm. F. Carroll, assistant.

L. D. McClure of Miami, Ariz., has completed arrangements to take over about 20 mining claims lying between the Bonney and "85" properties. Franklin Wheaton Smith, M. E., has been here for a week examining and reporting upon the various properties, and some very favorable looking property has been secured. While there has been little development

upon these claims so far, there is every indication that valuable ore bodies will be opened up. The men backing the project were the organizers of the Old Dominion Extension Copper Co. of Miami. Claims owned by the following people have been taken over: Scarboro, Block, Reynolds, Trimble, Hayden, Fuller, Chase, Olney, Blackburn, Peterson and Sherer.

Wright Bros., who have the contract for putting down a 3-compartment shaft for the Octo Mining Co. at Lees Peake, are down 150 ft., having been hampered by an excessive flow of water. They are now using a 600-gal. Pierce pump, secured from the C. & A. at Warren, Ariz.

The new company is to be known as the "85" Extension Copper Mining & Development. It is the intention of the new company to begin development work soon.

The Green King, owned by D. W. Briel, Jesus Soto and J. W. Dunn, lying south of the "Happy Hooligan," shows a 3-ft. vein of rich copper sulphide opened at 65-ft. depth. The ore has high-grade sulphides, carrying some oxides. It is reported that an offer for \$50,000 is being considered for the property.

Thomas A. Lister, who owns the Barney Extension group of claims has opened a vein of \$36-ore on the Happy Hooligan at shallow depth. Several parties are after the property under lease and bond.

J. L. Wells, M. E., who has leased the Nellie Gray property, lying 600 ft. north of the Barney, has installed a steam hoist to open up new rich ore recently struck on the south side of the main shaft on the second level.

The Manilla and Mulberry claims, which carry the extension of one of the rich Bonney veins to the east, have been taken under lease and bond for \$25,000 by A. E. Shedoudy. Under the terms of the lease, 20 full shifts per month must be worked and a royalty of 15% is to be paid on all ore shipped. Some very fine ore is being taken out on the 85-ft. level.

A lease and bond has been taken upon the Farley and Kilebrough group of claims by Wright Bros. of Bisbee. The price was \$50,000. The property consists of six claims and three fractions, lying between the Bonney and the "85" properties. A double compartment shaft is now being sunk near the T. A. Lister claims on a 3-ft. vein, showing values in gold, silver and copper.

OREGON.

Riddle.

The Eldorado Copper Mining Co., capitalized for 2,000,000 shares at \$1 each, has been organized by Spokane and Oregon men to take over and operate the Banfield copper mine, 32 miles east of here, on the main line of the Southern Pacific Railway. The reported price is \$300,000, part cash and the remainder stock in the new corporation. The incorporators are Andrew Laidlaw and S. W. Miller, Spokane; C. P. Ritter, attorney of Indianapolis, Ind., and F. W. Beyer, banker, and Henry Banfield, one of the original owners of the property, both of Riddle. "The Banfield mine is one of the best known copper properties in southern Oregon, and many well posted mining men regard it as the largest high-grade copper deposit in the state," said Laidlaw. "The group first was located in 1900 by two half-breed Indians, Thomason and Cantile, and 2 years later Henry Banfield, a mining engineer, acquired an interest. Eventually he secured title to the entire holdings, comprising nine full claims, and incorporated the Douglas-Umpqua Mining Co. to operate them.

"Development has been continued during the last 14 years and six tunnels have been driven, one above the other, the lowest at the face being approximately 900 ft. below the surface. These tunnels and drifts aggregate fully a mile in length, and, conservatively speaking, there are now on the dumps and blocked out in the mine, more than 300,000 tons of ore that engineers estimate will average 4% in copper, besides some values in silver and gold. Only three of the nine known ore bodies have so far been opened, these being 50, 40 and 28 ft. in width. Ten feet of the ore body in the No. 1, or 50-ft. ledge, assays from 7 to 9% copper and 4 ft. of the No. 3, or 28-ft. ledge, shows even higher value. By

continuing the lower tunnel about 300 ft. farther, another big ledge, approximately 60 ft. in width, showing the same surface values as the other ledges, will be opened and approximately 2500 ft. farther south there is still another larger outcrop on which little work has been done, but which looks as promising as any on the property. The tunnel, when it reaches this ledge will have a vertical depth of more than 1500 ft. It is estimated that there are between 10,000 and 15,000 tons of ore on the dumps that carries from 2 to 20% copper, and the new company soon will begin shipping this to the smelter. Our concern is organized under the laws of Washington and the head offices will be maintained in Spokane."

SOUTH DAKOTA.

Lead.

Continuous operations are being maintained at Homestake's tungsten concentrating plant, with satisfactory results. Ore is being taken from the old dumps on the West Lead ground and the shoot in the mine is being developed, furnishing sufficient material to keep the 5-stamp mill working up to about capacity. A car of concentrates, amounting to 25 tons, was sent out the week ended Dec. 9. The grade was 60% or better.

As usual, work has been suspended at the Wasp No. 2. This is because there is no telling when weather conditions of the winter months will increase the production cost and on gold, the company operates with a small profit margin. Some good grade tungsten ore is in sight and work was continued on this after the mining of quartzite was discontinued Dec. 2. It was the intention to put this through the mill and probably make a shipment of high grade in the near future.

Custer City.

Plans for a mill at the Custer Peak, it is said, have been drawn up and construction will probably start in the spring. The water which was encountered while sinking the main shaft has subsided some. The shaft is now cutting formation heavy in pyrite and carrying good gold values. Samples from the copper struck on the 100 level show as high as 14%

Hill City.

The Consolidated Copper Co., recently formed by Pennsylvania interests, is progressing with the work of reopening the Golden Summit mine. Unwatering the main working shaft and workings connected with it is well under way. The water has been lowered to a depth of about 125 ft. From a depth of about 150 ft. on the shaft has been sunk on an incline, a depth of about 230 ft. in all being attained. A boiler and dynamos have arrived and are to be taken to the mine soon.

George Alton has been made manager of the Hill City Tungsten Co. and milling operations are under Supt. Jordan. As yet all of the motors for the mill have not arrived. A drift is being run from the main shaft along the course of the free milling vein that has been exposed on surface for 3000 ft. with an average width of 15 ft. This drift was started from the 100-ft. level of the shaft. It has reached 65 ft. from the station. It is all in ore and average assays show over \$6 gold. Some free-gold specimens have been taken from the vein. It is as strong at the face of the tunnel as when it was started on. The force of miners working will probably be increased shortly and work continued all winter.

UTAH.

Bingham.

The 100-ton sulphuric acid plant of the Garfield Chem. & Mfg. Co. started operations Dec. 1. It is backed by Utah Copper and American Smelting & Refining Co. The leaching plant of Utah Copper mill will not be ready until June 1, 1917. In the meantime Garfield Chemical expects to supply many leaching plants in Montana, Washington and Utah. The plant was constructed at the cost of more than \$500,000

and within a short time will be producing 150 tons a day. It has in connection a concentrating plant, which, with the original plant, will produce three grades of sulphuric acid.

Alta.

Power drills will supplant hand drills at the West Toledo in a few weeks. The most recent work has been in the old upper workings, where a small force of men is now clearing up in preparation for machine work. Lee Glockner will have charge of operations. The property is south of the Cardiff.

A 100-ft. tunnel driven on the Victor 400 ft. under the Tar Baby workings has encountered the lime footwall of the Cardiff. After striking the lime formation, the tunnel has been sent southeast, where it is expected to strike the contact where the fissure intersects. Mgr. Green believes he has struck the Cardiff contact, and says he will cut the Cardiff ore body, which is believed to continue along the contact into the Victor.

During the 9 days previous to Dec. 7 Michigan-Utah shipped 20 cars of \$30 ore. It was all gotten out by leasers. The assays showed 45 cts. gold, 15.15 ozs. silver, 6.15% lead, 3.075% copper, 25.85 insoluble and 13.2% iron. The ore is a mixture from the product from both the City Rocks and Grizzly workings. In the Copper Prince tunnel, the ore is 8 ft. thick, with silver, lead and copper values aggregating \$50. The company has developed this body more than 400 ft. from the Lavinia tunnel to the Copper Prince tunnel and as the ore is continuing to go down the prospect that the Michigan-Utah has of becoming one of the greatest producers of the district continues to grow brighter.

Work on a 55-ft. winze, sunk to develop a bedded vein of silver-lead at Alta Con., has been stopped. These men have been put to work drifting from the Copper Prince tunnel of the Michigan-Utah to get under the bottom of the winze at greater depth, when a raise will be sent up and connection made. General Manager Jacobson said: "This drift will be not more than 150 ft., while another drift that has been started from the same tunnel will be in Alta Con. ground inside of 75 ft. Both these drifts will cut into the low grade body at depth. One of them will be 500 ft. under ground." Arrangements have been made with Michigan-Utah to use its tramway at night to convey ore from the mine to Tanners Flat. It is expected to have 50 to 60 tons moving daily when the rail connection is made at Tanners Flat.

Milford.

Development tunnels in the Black Rock Mining & Milling Co.'s property are nearing mineral zones. The main shaft has been retimbered to the 190 level. A force of men is now sending a drift out to crosscut two fissures that outcrop prominently through the property. These fissures are in the limestone and show good values in copper as well as some gold and silver. They expect to reach the first of these fissures in about 60 days. The two are parallel and not more than 25 ft. apart.

Arrangements have been completed to start regular shipments of commercial ore from the Antelope Star on Jan. 15, 1917. The Creole has been put in shape. Power drills and a compressor are to be installed and regular shipments of 4 cars a week, started during this week. The company has taken over the ground from lessees who have taken out 80 cars netting about \$41,000. An ore body said to be 1880 ft. long, 300 ft. wide and known to be 285 ft. in depth, is reported to have been proved by the lessees. The company is securing its copper from two 20-in. streaks, which yield 23%, while the values in the faces of all the workings range from 3½ to 4% copper and some silver and gold.

Ogden.

Actual operations at the mines of the Wolf Mountain Copper Co. are to begin in a few weeks, says C. A. Harker, president of the company. Development has been steadily going forward within the last year. Mining will progress rapidly because of the proximity of an electric power transmission line, with the further advantage that the property contains a sufficient amount of timber for use as props, as well as an ample water supply. The work of installing a compressor and machine drills is about completed. Reports from the company's engineers are to the effect that 20,000

tons of ore are in sight and the company has not yet tunneled to the main body. Reports on trial shipments show 5.5% copper and 1.5 ozs. silver.

Park City.

At the property of the Three Kings Silver Mining Co. the winze has penetrated the 40-ft. of grey limestone and reached the shale contact. Here some silver and lead values are found. The winze is 130 ft. deep and is sunk from the floor of the 500 level. The winze was sunk on a fissure that strikes into both the Silver King Coalition, where ore is said to have been found, and into the Silver King Con. on the other side. A drift will be sent out southwest from the bottom of the winze into a mineralized section soon.

At the California-Comstock leasers are working on the 200 levels, from which good returns are being obtained. Silver King Con. has purchased the Silver Bell and at Beed's Peak a tunnel is being driven for a carbonate fissure vein. At the Iowa Copper ore is widening with depth in the incline winze. Two shifts are working and a compressor and drills have been ordered.

Eureka.

At Eureka King it is expected to start the new 2-compartment shaft before Jan. 1. It is the intention to sink to the 300 level and crosscut east. This should reach a porphyry dike in about 70 ft. The dike dips west and cuts the limestone. A boarding house for 18 miners is nearly complete and a blacksmith shop and shaft house will be started immediately.

Wages have been increased in the district again, by most of the companies, to the extent of 25 cts. The wages which prevailed after Dec. 1 were: Muckers, \$3.50; miners, \$3.75; machine men, \$4; shaft men, \$4.50.

The tunnel on the 1300 level of Iron Blossom, which was run west to cut a copper body, has failed. The management has now started another drift east and it is believed that work in that direction will result in a strike. It is stated that the copper deposit is 8 ft. wide on the 1200 and is so strong at that point that it cannot hardly fail to extend to the 1300. The mine has been shipping heavily during the past few weeks.

WASHINGTON.

Spokane.

The United Copper Mining Co., which owns and operates the United Copper mine and mill at Chewelah, on Dec. 5th declared the regular monthly dividend of 1 ct., or \$10,000, payable Jan. 15, to stock of record Jan. 1. United Copper resumed dividends last month after a suspension of 4 years. The January payment will increase the grand total to \$60,000, four payments of \$10,000 each having been made in 1912. Arrangements now are being made to list United Copper stock on the New York curb, and the issue probably will be called there in the next few weeks. President Conrad Wolfe states that conditions at the property are the best in its history and that there is every reason to believe that monthly dividends of not less than 1 ct. a share, and perhaps more, can be maintained indefinitely. The mill, remodelled and equipped with a modern flotation and separation system, now is effecting an exceptionally high percentage of saving, and the smelting contract has been renewed at a satisfactory rate. Directors have authorized sinking a 2-compartment shaft from the 1000 level, near the intersection of the crosscut tunnel with the vein, to the 1500 level. Diamond drill exploration has proven the ore for 400 ft. below the lowest workings, and the shaft will be sunk on this body. The shoot has been opened for 1300 ft. by drifts both ways from the crosscut, the vein ranging from 2 to 20 ft. in width and averaging 8. A station will be cut at the shaft collar and hoisting, actuated by electricity, will be installed soon after Jan. 1.

There is greater activity in the mines of the Republic region than ever before and the crude ore shipments from the different properties now are averaging about 200 tons daily, according to George S. Bailey, superintendent of mines for the Northport Smelting & Refining Co., controlled by the Day interests, which recently purchased the Lone Pine-Pearl-

Surprise group of gold claims from the Republic Con. Mines corporation for \$150,000. "We are producing a large part of the tonnage of the camp and extensive development of our holdings is under way," said Bailey. "The 3d, 4th and 5th levels of the Lone Pine claim, opened by an incline shaft, are being extended west on the vein, and a drift is being run north on the vein in the Pearl claim, at a depth of 300 ft. The shaft on the Surprise claim, which covers 2700 ft. of the Surprise vein, is being sunk to the 600 level, and it is probable that an upraise will be run from the 500 level to make the working vertical instead of incline. A 500-ft. shaft, being sunk by contract, now is down 65 ft. on the Last Chance mine, owned by the Lone Pine-Surprise Mining Co., of which Charles P. Robbins of Spokane is president and general manager. A new compressor plant and hoist have been installed at the property, which has a remarkably good showing, and it is believed that production can be inaugurated as soon as the shaft is down to the old workings, opened from the Insurgent claim, adjoining. Shipments are proceeding from the Knob Hill, Hope and Old Republic properties, the latter under the direction of the Rathfon Reduction Co. Production from the Hope, which is under lease, is being made from a new shaft 100 ft. north of the tunnel, in which a depth of 75 ft. has been attained. Production from the Old Republic is being made through the No. 3 tunnel. The Carey Mining Co. and the Adirondack Mining Co. are installing plants in the Sheridan district."

WISCONSIN-ILLINOIS.

Platteville.

Deliveries of zinc ore to smelters and local refining works for the week ending Dec. 9 were reported as follows: To Mineral Point Zinc Co., 49 cars, 1840 tons; Grasselli Chemical Co., 29 cars, 1096 tons; Wisconsin Zinc Co., 32 cars, 1258 tons; National Separators, 19 cars, 783 tons; American Zinc Co., 12 cars, 510 tons; Eagle-Picher Lead Co., 8 cars, 332 tons; scattering, 25 cars, 973 tons; total, 174 cars, 6,792 tons. Four cars of lead ore were shipped, 183 tons. Pyrites came from the reduction works of the Mineral Point Zinc Co., Linden Zinc Co. and National Separators, 770 tons in all. Splendid weather and road conditions, lessened tension in the labor demand not entirely ameliorated, constant power service regarded as fair, and continued high prices for ore combined to stimulate production, the recovery of mine-run ore for the week exceeding 6000 tons net shipments to smelters. The Mineral Point Zinc Co. shipped to smelter direct from its two separating plants to DePue, Ills., 18 cars top grade blende, 671 tons.

Local producers made a weak showing for the week, 1 car coming from the Klar-Piquette mine, 1 from the East End and 2 cars high grade from the Block House Mining Co. to Lanyon Zinc Co.

A faltering spelter market affected price offerings on zinc ore, the range on standard 60% and premium grades of zinc ore going from \$97 to \$105, while medium and second grades were shaded down to \$95 on grades as low as 50% zinc. Lead made new gains, going to \$97 per ton. Low grade shippers had a busy week.

Mifflin.

Grunow, Peacock, Peni, Lucky Six, B. M. & B., Biddick, Cokers, Senator and Big Tom companies figured in the shipments last week, 23 cars all told, 895 tons. The B. M. & B. is installing an aerial tram. The Biddick is milling 25 tons daily. The Senator mine is shut down for repairs, but mill feed is being stacked up at the rate of 100 tons daily. The Big Tom is engaged with drills, in exploration work. The Grunow has adopted the contract system. Peni Mining Co. has closed a deal with Grasselli Chemical for its entire reserve, estimated at 400 tons, 55% zinc. The Lucky Six continues drilling operations with a fair measure of reward. A new plant completed for the Vinegar Hill Zinc Co. on the Yewdall mine is handicapped for want of a sufficient water supply to keep the mill going full time. The Peacock Mining Co. after much underground development is again in mineralized areas and making 10 tons of high grade concentrate

daily. Drills are engaged for the New Jersey Zinc Co. on the Coker allotments and 50 tons of zinc concentrate are recovered daily. Water shortage for milling is reported.

Highland.

Only 1 car of carbonate ore cleared from this district last week. The Imhoff-Egan Co. has been re-organized and a new force of miners are working on the double shift. The Burchichter Co. made a rich strike of lead ore. The Red Jacket mine is operating steadily with fair returns. New Jersey Zinc Co. continues drilling operations in a quest for water to furnish a new 200-ton mill, complete and ready for service with the necessary supply to insure steady milling. Fifty men will be required as soon as a supply has been obtained. Saxe-Lampe Co. is working 40 miners on double shift and is in a strong deposit of bone and lead. Sphalerite in volume is coming in with indications of deposits in volume ahead. Two cars of ore are recovered weekly, but a much better showing it is said will be made.

Dodgeville.

This district is waking up and showing form. New shippers to report last week were the Guthrie Mining Co. and Pengelly Mining Co., the former with 2 cars of hand-cleaned jack and the latter with 1. Shipments of high grade zinc ore came from the O. P. David at Montfort last week, 44 tons. One car of lead ore was delivered to the Eagle-Picher Lead Co.

Cuba City.

The National Separating Works, running full time, turned out 5 cars of premium grade jack to Illinois Zinc Co. last week, 197 tons; 5 cars to American Zinc Co., 210 tons. The reduction works of the Linden Zinc Co. yielded 2 cars of premium grade delivered to American Metals Co., 76 tons. The G. O. P. Mining Co., made up of Platteville mining men and now operating the Big Eight mine, made its initial shipment to Benton Roasters, 1 car, 40 tons.

Benton.

Shipments last week reflected old time form, 70 cars of zinc ore going to track for a total of 5,734,000 lbs. The Wisconsin Zinc Co. took the lead on tonnage delivered, 15 cars, 618 tons, going to the Skinner Separating plant from the C. A. T. and Champion mines. New Jersey Zinc Co. came up strong with 13 cars from the Fox and Penna-Benton mines, 520 tons, to Mineral Point Reduction works. Frontier Mining Co. to Grassellis, 11 cars, 438 tons; Vinegar Hill Mining Co. from Blackstone, Martin and Kittoe mines, 9 cars, 380 tons; Fields Mining & Milling Co. to Grassellis under contract, 9 cars, 280 tons. Longhenry, Indian Mound and Sally Mining companies to separators, 1 car each. Benton Roasters, finished ore to Eagle-Picher Co., 50 tons; Wisconsin Zinc Co., all high grade to American Zinc Co., 4 cars, 170 tons; to Eagle-Picher Co., 5 cars, 200 tons. The Buchan Mining Co., incorporated earlier in the year, is down in ore through a shaft that entailed much labor, heavy pumping and much shooting. New equipment has been provided and the Buchan will soon be recognized in connection with shipments.

Shullsburg.

The Winskill mine, has increased its output of zinc ore and shipments last week were run up to 7 cars, 267 tons, to Skinner Separating plant. Welsh & Co. marketed 2 cars of sludge, 66 tons, and the Mulcahy mine delivered 5 cars of premium refinery ore to Edgar Zinc Co., 210 tons.

Hazel Green.

Improvement was shown in shipments of zinc ore from this district last week, the Kennedy mine sending its usual 4 cars, 160 tons; Cleveland Mining Co. to Grassellis, 2 cars, 80 tons; to Wisconsin Zinc roasters, 2 cars, 80 tons; Lawrence Mining Co. to Galena, 3 cars, 120 tons.

Galena.

The Black-Jack maintains its reputation as a producer, sending 6 cars crude ore to Mineral Point, 240 tons; the Birkbeck mine, a Wisconsin Zinc Co. development, has not been opened up to full advantage, but it figured in the shipments last week with 1 car. Graham and North Unity to Cuba, 5 cars, 195 tons. Only 2 cars of high grade refinery ore cleared for the week and were from the Wisconsin Zinc Co.'s Joplin works to American Zinc Co., Hillsboro, Ill., 90 tons.

WYOMING.

Lander.

A. E. Minium during the past year has opened up his asbestos property enough so that a good idea of its extent and quality can be determined. The fibre is good and it is selling for an average of \$125 a ton. Recently D. A. Dom, representing the Phillips-Carey Mfg. Co., Cincinnati, made an examination of the properties. If this is favorable, Phillips-Carey will probably purchase the property for a source of raw product for the company.

CANADA.

BRITISH COLUMBIA.**Trail.**

The Consolidated Mining & Smelting Co., which owns and operates the Trail plant and a number of mining properties in British Columbia and northern Washington, has declared its first quarterly dividend for 1917. The payment, to be distributed Jan. 2, to stockholders of record Dec. 31, will be at the rate of 2½% on the issued capitalization, or \$210,867, and will increase the grand total to \$3,306,892. The share capitalization of the company was increased several weeks ago by 25%, the additional issue to be subscribed for by the old stockholders at par, \$25 a share, subscriptions to be limited to one share of the added stock to each four shares formerly held. All stock on which full payments have been made by Jan. 1 will participate in dividend declarations thereafter, according to the official announcement, and this leads to the belief that none of the new issue will be eligible for the disbursement Jan. 2.

Phoenix.

On a basis of 29-ct. copper, the Granby Con. Mining, Smelting & Power Co. is earning at the rate of \$66 a share annually, according to official report, and it is believed that the regular quarterly dividend, to be declared in February and paid in March, will be increased from \$2 to \$2.25. Disbursements were increased from \$1.50 quarterly to \$2 in June, 1916. Anyox production at the present time is a little less than 3,100,000 lbs. per month, or at the rate of 37,000,000 lbs. annually, while at Phoenix the output of about 1,275,000 lbs. per month is equal to about 15,300,000 lbs. annually. Total output of the company, therefore, is at the rate of over 52,000,000 lbs. of copper per annum. The cost of production at the Hidden Creek property is about 9 cts. compared with 15 at the Granby, or Phoenix property. Earnings at Hidden Creek, on 29-ct. basis, are at the rate of \$7,500,000 annually, and at Phoenix \$2,500,000, making Granby's earnings at the present time at the rate of \$10,000,000, or about \$66 per share on the 149,985 shares of outstanding capital stock. President E. P. Earle stated at the annual meeting in November that Granby had participated to a considerable extent in the 448,000,000-lb. order for copper placed during September for the allies. As this order was placed at around 26 cts., due allowance must be made, and as the annual report of the company for year ended June 30, 1916, showed a net surplus of over \$3,800,000, which is more than sufficient to take care of the outstanding bonds, Granby in the fiscal year to end June 30, 1917, should show net earnings of at least \$7,500,000, or \$50 per share.

Silverton.

The Standard Silver-Lead Mining Co. has declared the regular monthly dividend of 2½ cts. a share on the total capitalization of 2,000,000 shares, making \$50,000 payable Dec. 10 to stockholders of record Dec. 1. This will make the payments for the current year \$600,000 and will increase the grand total to \$2,400,000, or \$1.20 the share paid to shareholders since disbursements were inaugurated in 1912.

Sandon.

Solid lead ore in a body of undetermined size has been struck in the property of the Slocan Star Mines, according to Oscar White, superintendent. The strike was made on the No. 3 level, where a greater part of the zinc ore has been

stopped in recent months. The announcement came close upon the strike, so little time for further investigation has elapsed. The No. 3 level is in the old workings at a depth of perhaps 500 ft. The zinc shoot at that horizon has a width of 18 to 20 ft. The new body is attractive in its speculative possibilities. One of the largest of these possibilities would be the succession of zinc by lead in a body of those dimensions.

ONTARIO.**Cobalt.**

At the Dominion Mines surface development is being done on a north-south vein and they will be developed underground when colder weather prohibits surface work. The vein strikes towards the high ridge in the Keewatin formation. The management is of the opinion that the vein will become a producer. It is from 1 to 2 ins. wide and the shoot has been proven on surface for 150 ft. Four or five other veins have been located but these do not contain high grade. About 2 tons of high grade have been sacked which, it is said, run 25 ozs.

At a recent meeting of the Gifford Cobalt Mines Co. it was decided to increase the capitalization from \$250,000 to \$1,000,000. Shares will be offered to stockholders at 5 cts. A new shaft house is now being considered. Work of cleaning the old workings was started in Jan., 1916. Since then a crosscut has been driven at the 200 level east for a distance of 238 ft. and a winze started on a quartz-calcite vein and continued to a depth of 110 ft. This vein dipped towards the granite at 59 ft. A 2½-in. calcite-cobalt vein and a mud-seam 4 ins. wide immediately came in here. In this section of the camp these veins do not carry high values at this depth. The winze, sunk 110 ft., has another narrow vein. These veins all dip to the east and are still in Keewatin. Calcite stringers appear frequently.

Porcupine.

At West Dome new machinery has been installed, a diamond drilling campaign is being pressed and it is expected that by March 1, 1917, the new shaft will be completed to the 300 level. The transformers have been set and a 12-drill compressor is being run by a 100-hp. motor in place of steam. The steam plant will be used in future as an auxiliary. The new hoist has been installed over the recently commenced shaft and to date 30 ft. of sinking has been done. There are 45 men working at the present time. In order to more rapidly sink the new shaft a crosscut is being run from the old No. 1 shaft. It will be continued for 1400 ft. when raising on the new shaft will be commenced.

By diamond drilling at the Porcupine-Keora it is proposed to cut the main vein at a depth of 1000 ft. On surface this vein has in places a width of 40 ft. carrying low grade milling ore. Several other veins uncovered on surface between the main vein and where the first diamond drill hole will be started should also be cut.

Matheson.

Diamond drilling is being done on the property of the Burton Gold Mines, Ltd., in Munro township. A short time ago a promising vein was found on the lot in a section burned clean by the fire. Visible gold was found in the vein and it is now proposed to drill this and the several other veins. Outside of a small amount done by the Croesus to locate a high grade vein at depth, that being done on the Burton is the first time that the diamond drill has been used in Munro township.

Boston Creek.

Diamond drilling on the Crawford-LaPalme claims has been satisfactory and now three shafts are to be sunk. These have been started by hand, but a plant is to soon be installed. The hole was drilled through a wide porphyry dyke which is cut by stringers and veins of quartz. One of these veins gave particularly good results, about 18 ins. showing considerable free gold.

It is being considered to install a compressor at the Boston Gold Leaf in the spring. About 4 men only will be kept during the winter and they will be confined to surface development work. The shaft on the property is down 73 ft. The vein looks good and the average grade is fair. The vein at the lowest point in the shaft is about 3 ft. wide, the walls being slightly irregular, but defined.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Iron and Steel

Comstock, George F.—*A Method of Distinguishing Sulphides from Oxides in*

the Metallography of Steel. [Points out places where many mistakes are today being made in the use of this art for minutely studying the structure of steel].—A. I. M. E. Bull. Dec. 1916; p 2103; pp 8*; 35c.

Pulsifer, H. B.—*The Determination of Sulphur in Iron and Steel.* [The many methods used in the past and today are briefly described and discussed and the bibliography of 285 articles on the subject is given].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1115; pp 8½*; 60c.

Swindin, N.—*The Design of Acid-Resisting Iron Apparatus.* [Tells considerably about the making of castings and treatment of the iron to be used in the same].—Chem. Tr. Jnl. No. 59 1916; p 323; pp 2.

—*The Swedish Iron, Steel and Coal Industry in 1915.* [Some of the statistics, curves, etc., are taken from Jernkontoret's Annaler].—I. & C. Tr. Rev. Nov. 17 1916; p 614; pp 1*; 35c.

Lead

Ball, Sydney H.—*The Lead Mines of Washington County, Missouri.* [A brief description of the geology of the deposits and operations and methods of working the deposits].—M. & S. P. Dec. 2 1916; p 807; pp 3¼*; 20c.

Heikes, V. C.—*Gold, Silver, Copper, Lead and Zinc in Utah in 1915.* [Separate reviews of operations and production of the different counties. Conditions of the industry in the state as a whole are given and each of the metals is reviewed separately].—Min. Res. of U. S. 1:15; pp 35.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915.* [Both states are reviewed separately and separate reviews of the metals produced and operations by counties are included].—Min. Res. of U. S. 1:14; pp 27.

Loveman, M. H.—*The Geology of the Bawdwin Mines, Burma, Asia.* [Complete, detailed description of these lead-zinc sulphide deposits which have been worked since ancient times is given].—A. I. M. E. Bull. Dec. 1916; p 2119; pp 25*; 35c.

Root, W. A.—*Aspen, Over the Range in Pitkin County, Colorado.* [The history of the camp and several of the companies operating in it are included in the description].—Mg. World Dec. 2 1916; p 943; pp 2¾*; 10c.

Scott, W. A.—*Sulphidizing Carbonate Tailings for Treatment by Oil Flotation.* [While being agitated the crushed ore as carbonate is changed to a metallic sulphide by the addition of sodium sulphide].—Mg. World Dec. 2 1916; p 946; pp 1; 10c.

—*California Mineral Production.*—E. & M. J. Dec. 2 1916; p 971; pp 1½; 25c.

Silver

Heikes, V. C.—*Gold, Silver, Copper, Lead and Zinc in Utah in 1915.* [Separate reviews of operations and production of the different counties. Conditions of the industry in the state as a whole are given and each of the metals is reviewed separately].—Min. Res. of U. S. 1:15; pp 35.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915.* [Both states are reviewed separately and separate reviews of the metals produced and operations by counties are included].—Min. Res. of U. S. 1:14; pp 27.

Loveman, M. H.—*The Geology of the Bawdwin Mines, Burma, Asia.* [Complete,

detailed description of these lead-zinc sulphide deposits which have been worked since ancient times is given].—A. I. M. E. Bull. Dec. 1916; p 2119; pp 25*; 35c.

Root, W. A.—*Aspen, Over the Range in Pitkin County, Colorado.* [The history of the camp and several of the companies operating in it are included in the description].—Mg. World Dec. 2 1916; p 943; pp 2¾*; 10c.

Scott, W. A.—*Sulphidizing Carbonate Tailings for Treatment by Oil Flotation.* [While being agitated the crushed ore as carbonate is changed to a metallic sulphide by the addition of sodium sulphide].—Mg. World Dec. 2 1916; p 946; pp 1; 10c.

—*California Mineral Production.*—E. & M. J. Dec. 2 1916; p 971; pp 1½; 25c.

—*Mining and Milling at the Santa Gertrudis, Mexico.* [The cyanide process is used here and the text is a discussion of a previous paper].—A. I. M. E. Bull. Dec. 1916; p 2197; pp 3; 35c.

Silver Milling, Metallurgy, Etc.

See Mill and Milling, Metallurgy, Chemistry, Assaying, Etc.

Zinc

Bretherton, S. E.—*Electrolytic Practice.* [Correspondence speaking of previous penalizing for zinc in some ores and the doing away of this through the introduction of the electrolytic process developed by the Anaconda Co.].—M. & S. P. Dec. 2 1916; p 793; pp 2; 20c.

Heikes, V. C.—*Gold, Silver, Copper, Lead and Zinc in Utah in 1915.* [Separate reviews of operations and production of the different counties. Conditions of the industry in the state as a whole are given and each of the metals is reviewed separately].—Min. Res. U. S. 1:15; pp 35c.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915.* [Both states are reviewed separately and separate reviews of the metals produced and operations by counties are included].—Min. Res. of U. S. 1:14; pp 27.

Loveman, M. H.—*The Geology of the Bawdwin Mines, Burma, Asia.* [Complete, detailed description of these lead-zinc sulphide deposits which have been worked since ancient times is given].—A. I. M. E. Bull. Dec. 1916; p 2119; pp 25; 35c.

—*California Mineral Production.*—E. & M. J. Dec. 2 1916; p 971; pp 1½; 25c.

—*Statistical Position of Spelter.*—[Editorial review].—E. & M. J. Dec. 2 1916; p 993; pp 1; 25c.

(II) NON-METALS

(A) FUELS

Coal Fields and Mining

Blake, A. F.—*A Graphic Chart for the Valuation of Coal.* [The chart is reproduced and from it the values can be obtained according to the water, ash and B. T. U. content of the coal in question].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1140; pp 2¾; 60c.

Brown, J. F. K.—*Tenure of Coal Ages.* [Describes and discusses four systems for the acquisition and operating of coal lands].—Coal Age Dec. 2 1916; p 912; pp 3; 20c.

Campbell, F. W.—*Working Over an Old Mine.* A system being used by the Nay Aug Coal Co., Dunmore, Pa., by which it is mining ground mined and partially

robbed already].—Coal Age Dec. 2 1916; p 924; pp 134*; 20c.

Graham, Thomas.—*Gaseous Mines in the Crow's Nest Pass Coal Field, British Columbia*. [A paper read before the Mine Inspector's Inst. in which considerable is said of the mines of the district and methods of sampling the air].—Coal Age Dec. 2 1916; p 920; pp 3½*; 20c.

Pickup, William.—*Effects of Labor Movements and Legislation on the Economic Position of Coal Mining*. [A paper read before the Manchester Geol. and Mg. Soc., England].—I. & C. Tr. Rev. Nov. 17 1916; p 609; pp 1; 35c.

Pleschner, O. J.—*Design for Auxiliary Shaft*. [This auxiliary hoist shaft does away with the necessity of detouring the air from the shaft around the passages leading to the other shaft compartments].—Coal Age Dec. 2 1916; p 915; pp 1½*; 20c.

—*Stone Dusting in Steam Coal Collieries*. [Discussion before the South Wales Inst. of Eng.].—Colly Guard. Nov. 17 1916; p 953; pp 1½; 35c.

—*The Swedish Iron, Steel and Coal Industry in 1915*. [Some of the statistics, curves, etc., are taken from Jernkontoret's Annaler].—I. & C. Tr. Rev. Nov. 17 1916; p 614; pp 1*; 35c.

Petroleum

Kobbé, William H.—*Problems Connected with the Recovery of Petroleum from Unconsolidated Sands*. [Details for the opening up of such oil deposits are given in detail].—A. I. M. E. Bull. Dec. 1916; p 2253; pp 24*; 35c.

Egloff, G.; Twomey, T. J.; Moore, Robert J.—*The Effect of Temperature and the Time Factor in the Formation of Gasoline in the Gas Phase at Constant Pressure*. [The testing was mostly done with a Pennsylvania crude petroleum oil].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1162; pp 3¼*; 60c.

McCoy, A. W.—*Some Effects of Capillarity on Oil Accumulation*. [A paper read before the Geologic Conference of Oklahoma. It deals with the porosity of rocks and the attended capillary attraction as affecting oil deposits].—Jnl. of Geol. Dec. 1916; p 798; pp 8*; 75c.

Ohren, D. W.; Garrett, R. E.—*Ponca City Oil and Gas Field, Oklahoma*. [The geology, production and other items related to the field are spoken of and it is contended that many of the wells thought dry are not].—Okla. Geol. Surv. Bull. 16; pp 30*.

—*The Diastrophic Theory*. [Discussion of a paper by Marcel R. Daly with respect to the genesis of oil and gas deposits from an organic origin].—A. I. M. E. Bull. Dec. 1916; p 2204; pp 7; 35c.

Natural Gas

Clapp, F. G.—*Principles of Natural Gas Leasehold Valuation*. [Discussion of a paper by S. S. Wyer].—A. I. M. E. Bull. Dec. 1916; p 2228; pp 3; 35c.

Ohren, D. W.; Garrett, R. E.—*Ponca City Oil and Gas Field, Oklahoma*. [The geology, production and other items related to the field are spoken of and it is contended that many of the wells thought dry are not].—Okla. Geol. Surv. Bull. 16; pp 30*.

—*The Diastrophic Theory*. [Discussion of a paper by Marcel R. Daly with respect to the genesis of oil and gas deposits from an organic origin].—A. I. M. E. Bull. Dec. 1916; p 2204; pp 7; 35c.

III. TECHNOLOGY

MINES AND MINING

Surveying and Drafting

Parsons, J. L.—*An Office Record System for Civil Engineers*. [Details of methods for filing surveys, literature, etc.].—Engg. & Cont. Nov. 29 1916; p 466; pp 4*; 20c.

Wuensch, C. Erb.—*The Scientific Numbering of Mine Workings*. [A systematic method of numbering mine stopes, drifts, crosscuts and other workings].—E. & M. J. Dec. 2 1916; p 977; pp 1¼*; 25c.

—*Cost Records of Drafting and Engineering*. [Forms and descriptions of the same for the distributing and keeping of costs on different jobs].—Engg. & Cont. Nov. 29 1916; p 472; pp 2*; 20c.

Ventilation

Lewis, W. K.—*Formulas for the Flow of Gases*. [Many formulas are given, derived and discussed which may be applied to work in mine ventilation].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1133; pp 6½; 60c.

—*Equipment of the Valleyfield Colliery*. [Gives drawings and description of the steam-turbo and electric plants, besides a description of the coal washing plant and fan and boiler house].—Colly Guard. Nov. 17 1916; p 951; pp 2½*; 35c.

Lighting

—*Cap Lamp with New Feature*. [An electric lamp with a straight filament passing horizontally across the reflector].—Coal Age Dec. 2 1916; p 918; pp 1¼*; 20c.

—*G-E Miners' Lamp Approved by the U. S. Bureau of Mines*.—Mg. World Nov. 18 1916; p 869; pp 1¼*; 10c.

—*History of the Carbide Mine Lamp from the Earliest Days to the Present Time*.—Acetylene Jnl. Dec. 1916; p 303; pp 1½*; 20c.

Dredging

Payne, F. W.—*Dredging for Minerals*. [Deals with the past and present operation of dredges by different companies, pointing out causes for their failure and success].—Mg. & Engg. Rev. Oct. 5 1916; p 17; pp 1¾; 35c.

Sargeant, E. W.—*Centrifugal Pumps and Suction Dredges*. [Among the features of the book is the simple and non-technical manner in which all things are described].—Chas. Griffin & Co., London; book; pp 188*; \$3.

—*Gold Dredging in Yukon*. [Abstract of a paper published by the Minister of Interior, Canada. The doings and equipment of operating companies in the district are reviewed].—Canadian Mg. Jnl. Nov. 15 1916; p 535; pp 10¾*; 35c.

Power Shovels and Excavators

Dixon, C. Y.—*Plant and Method of Dry Excavation, Livingstone Channel, Detroit River, Michigan*. [From Professional Memoirs. Pumping, drilling, costs, equipment used, etc., are included in this review].—Engg. & Cont. Nov. 15 1916; p 425; pp 2*; 25c.

—*Hulett Unloader as Applied to the Handling of Copper Ore*. [An excavator to handle the leached sands from the tanks at the plant of the New Cornelia Copper Co., Ariz.].—Mg. World Dec. 2 1916; p 951; pp 1*; 10c.

Shafts and Shaft Sinking

Scott, W. A.—*The Tonopah Extension Mines in Nevada*.—Mg. World Nov. 11 1916; p 831; pp 1; 10c.

Accidents

Fay, Albert H.—*Accidents at Metallurgical Works in the United States*. [They are given for the greater part in tabulated form and include 1915 only].—U. S. Bur. of Mines Tech. Paper 164; pp 20; 15c.

Geismer, H. S.—*Explosion at the Besic Mine, Alabama*. [Thirty men are believed to have been killed in the explosion in a mine of the Sloss-Sheffield Steel & Iron Co.].—Coal Age Nov. 18 1916; p 835; pp 2¾*; 20c.

—*Coöperative Effort in Mining*. [Discussion by several of a paper by Joseph P. Hodgson].—A. I. M. E. Bull. Dec. 1916; p 2168; pp 4; 35c.

Safety

—*Cap Lamp with New Feature*. [An electric lamp with a straight filament passing horizontally across the reflector].—Coal Age Dec. 2 1916; p 918; pp 1¼*; 20c.

—*Coöperative Effort in Mining*. [Discussion by several of a paper by Joseph P. Hodgson].—A. I. M. E. Bull. Dec. 1916; p 2168; pp 4; 35c.

Rescue and First-Aid

Pettibone, C. E.—*Testing Mine Rescue Apparatus*. [Abstract of a paper read before the National Safety Council. Advocates testing breathing apparatus with 5 ozs. internal pressure].—Coal Age Nov. 25 1916; p 875; pp 2½*; 20c; E. & M. J. Dec. 2 1916; p 985; pp 2½*; 25c.

Labor and Management

Bain, H. Foster.—*Labor Problems in African Mines*. [Interclass struggles, sanitation, schooling, etc., are things being given considerable study].—Mg. Mag. Nov. 1916; p 261; pp 6; 50c.

Key, A. Cooper.—*Miners' Phthisis Prevention*. [From a report of a committee investigating the disease on the Rand, South Africa].—E. & M. J. Nov. 18 1916; p 898; pp 2; 25c.

Pickup, William.—*Effects of Labor Movements and Legislation on the Economic Position of Coal Mining*. [A paper read before the Manchester Geol. and Mg. Soc., England].—I. & C. Tr. Rev. Nov. 17 1916; p 609; pp 1; 35c.

—*Coöperative Effort in Mining*. [Discussion by several of a paper by Joseph P. Hodgson].—A. I. M. E. Bull. Dec. 1916; p 2168; pp 4; 35c.

Production

Heikes, V. C.—*Gold, Silver, Copper, Lead and Zinc in Utah in 1915*. [Separate reviews of operations and production of the different counties. Conditions of the industry in the state as a whole are given and each of the metals is reviewed separately].—Min. Res. U. S. I:15; pp 35.

Henderson, Charles W.—*Gold, Silver, Copper, Lead and Zinc in New Mexico and Texas in 1915*. [Both states are reviewed separately and separate reviews of the metals produced and operations by counties are included].—Min. Res. of U. S. I:14; pp 27.

Ohren, D. W.; Garrett, R. E.—*Ponca City Oil and Gas Field, Oklahoma*. [The geology, production and other items related to the field are spoken of and it is

contended that many of the wells thought dry are not].—Okla. Geol. Surv. Bull. 16; pp 30*.

—California Mineral Production. —E. & M. J. Dec. 9 1916; p 971; pp 1½; 25c.

—Statistical Position of Spelter. [Editorial review].—E. & M. J. Dec. 2 1916; p 993; pp 1; 25c.

—The Swedish Iron, Steel and Coal Industry in 1915. [Some of the statistics, curves, etc., are taken from Jern-Kontoret's Annaler].—I. & C. Tr. Rev. Nov. 17 1916; p 614; pp 1*; 35c.

Mining Miscellany

Ball, Sydney H.—*The Lead Mines of Washington County, Missouri*. [A brief description of the geology of the deposits and operations and methods of working the deposits].—M. & S. P. Dec. 2 1916; p 807; pp 3¼*; 20c.

Campbell, F. W.—*Working Over an Old Mine*. [A system being used by the Nay Aug Coal Co., Dunmore, Pa., by which it is mining ground mined and partially robbed already].—Coal Age Dec. 2 1916; p 924; pp 1¼*; 20c.

Guignon, F. A.—*The Valuation of Bedded Mineral Land*. [Formulas for figuring the value when the mineral is being used, where it is not being used, where mineral is used and land has surface value and where mineral is not being used, but surface has value].—E. & M. J. Dec. 2 1916; p 969; pp 2½; 25c.

Manning, Van H.—*What Can Uniform Mining Laws Hope to Accomplish*. [A paper read before the American Mg. Cong., Chicago].—E. & M. J. Dec. 2 1916; p 973; pp 3¼; 25c. M. & S. P. Dec. 2 1916; p 796; pp 5; 20c.

Robertson, J. A. T.—*An Engineer's Travels in Western China*. [A graphic review of the province of Sze-chuan, China, as related to the mining industries of the province, which are in their primitive stages still].—Mg. Mag. Nov. 1916; p 267; pp 13*; 50c.

Scott, Herbert K.—*Manganese Ores of Bulkwovina*. [A paper read before the Iron and Steel Inst., London. Geology of the deposits, methods of mining, mining costs and selling prices and grades of the ore are among items considered].—E. & M. J. Nov. 25 1916; p 935; pp 3; 25c.

—*Cost and Extraction in the Selection of a Mining Method*. [Discussion of a previously read paper].—A. I. M. E. Bull. Dec. 1916; p 2180; pp 1½; 35c.

—*Mine Fire Methods Employed by the United Verde Copper Co.* [Discussion of a paper by R. E. Tally, telling considerable of methods used in the mines of the Anaconda Copper Co.].—A. I. M. E. Bull. Dec. 1916; p 2173; pp 7½; 35c.

MILL AND MILLING

Crushing, Grinding, Etc.

—*A Comparative Test of the Marathon, Chilean and Hardinge Mills*. [Discussion].—A. I. M. E. Bull. Dec. 1916; p 2184; pp 13½; 35c.

Flotation

Ralston, O. C.—*An Explanation of the Flotation Process*. [Discussion of a paper by A. F. Taggart and F. E. Beach].—A. I. M. E. Bull. Dec. 1916; p 2232; pp 2; 35c.

Ralston, O. C.—*The Flotation of Minerals*. [Discussion of a paper by R. J. Anderson].—A. I. M. E. Bull. Dec. 1916; p 2234; pp 2; 35c.

Scott, W. A.—*Sulphidizing Carbonate Tailings for Treatment by Oil Flotation*. [While being agitated the crushed ore as carbonate is changed to a metallic sulphide by the addition of sodium sulphide].—Mg. World Dec. 2 1916; p 946; pp 1; 10c.

Shellshear, W.—*Flotation of Gold and Copper Ores at Mount Morgan Mine, Queensland, Australia*. [Abstract of a paper read before the Aust. Inst. of Mg. Eng. The testing of different oils and different methods of concentration are told of].—Mg. World Dec. 2 1916; p 947; pp 1½; 10c.

Concentration: Sorting, Sizing, Washing

Root, W. A.—*Aspen, Over the Range in Pitkin County, Colorado*. [The history of the camp and several of the companies operating in it are included in the description].—Mg. World Dec. 2 1916; p 913; pp 2¾*; 10c.

Shellshear, W.—*Flotation of Gold and Copper Ores at Mount Morgan Mine, Queensland, Australia*. [Abstract of a paper read before the Aust. Inst. of Mg. Eng. The testing of different oils and different methods of concentration are told of].—Mg. World Dec. 2 1916; p 947; pp 1½; 10c.

Cyaniding

Eames, Luther B.—*Countercurrent Decantation*. [This article is also in the Bulletin of the Canadian Mg. Inst. The results of many tests are plotted into curves, showing the effect of many of the variables in the process on its efficiency].—A. I. M. E. Bull. Dec. 1916; p 2087; pp 15*; 35c.

—*Mining and Milling at the Santa Gertrudis, Mexico*. [The cyanide process is used here and the text is a discussion of a previous paper].—A. I. M. E. Bull. Dec. 1916; p 2197; pp 3; 35c.

Mill and Smelter Costs

Eames, Luther B.—*Countercurrent Decantation*. [This article is also in the Bulletin of the Canadian Mg. Inst. The results of many tests are plotted into curves, showing the effect of many of the variables in the process on its efficiency].—A. I. M. E. Bull. Dec. 1916; p 2087; pp 15*; 35c.

Shellshear, W.—*Flotation of Gold and Copper Ores at Mount Morgan Mine, Queensland, Australia*. [Abstract of a paper read before the Aust. Inst. of Mg. Eng. The testing of different oils and different methods of concentration are told of].—Mg. World Dec. 2 1916; p 947; pp 1½; 10c.

CHEMISTRY AND ASSAYING

Chemistry

Hallett, R. L.—*The Volumetric Determination of Tin*. [Discusses different volumetric methods, pointing out the advantages and disadvantages of each].—Jnl. Soc. Chem. Ind. Nov. 15 1916; p 1087; pp 3; 75c.

Pulsifer, H. B.—*The Determination of Sulphur in Iron and Steel*. [The many methods used in the past and today are briefly described and discussed and the bibliography of 285 articles on the subject is given].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1115; pp 8½*; 60c.

Analysis

Hallett, R. L.—*The Volumetric Determination of Tin*. [Discusses different

volumetric methods, pointing out the advantages and disadvantages of each].—Jnl. Soc. Chem. Ind. Nov. 15 1916; p 1087; pp 3; 75c.

Pulsifer, H. B.—*The Determination of Sulphur in Iron and Steel*. [The many methods used in the past and today are briefly described and discussed and the bibliography of 285 articles on the subject is given].—Jnl. of Ind. & Engg. Chem. Dec. 1916; p 1115; pp 8½*; 60c.

Ralston, O. C.—*Graphic Studies of Ultimate Analyses of Coals*. [A graphic method described in detail by which coals are classified and studied according to their chemical contents].—U. S. Bur. of Mines Tech. Paper 93; pp 41*; 20c.

METALLURGY

Electrometallurgy

Bretherton, S. E.—*Electrolytic Practice*. [Correspondence speaking of previous penalizing for zinc in some ores and the doing away of this through the introduction of the electrolytic process developed by the Anaconda Co.].—M. & S. P. Dec. 2 1916; p 793; pp 2; 20c.

Refractories

Nesbit, C. E.; Bell, M. L.—*Testing Refractory Fire Brick*. [Abstract of a paper read before the American Soc. for Testing Materials].—E. & M. J. Dec. 2 1916; p 967; pp ¾; 25c.

—*Refractory Materials*. [A discussion by the Faraday Soc. The advantages and disadvantages of many materials used in the making of refractories are included].—I. & C. Tr. Rev. Nov. 17 1916; p 606; pp 2½; 35c.

Thermic Metallurgy

Addicks, Lawrence.—*Possibilities in the Wet Treatment of Copper Concentrates*. [A paper read before the A. I. M. E. Curves are reproduced and the results of tests in roasting, leaching and chloridizing are dealt with].—Met. & Chem. Engg. Dec. 1 1916; p 628; pp 3*; 35c.

Hydro-Metallurgy

Bretherton, S. E.—*Electrolytic Practice*. [Correspondence speaking of previous penalizing for zinc in some ores and the doing away of this through the introduction of the electrolytic process developed by the Anaconda Co.].—M. & S. P. Dec. 2 1916; p 793; pp 2; 20c.

Scott, W. A.—*Sulphidizing Carbonate Tailings for Treatment by Oil Flotation*. [While being agitated the crushed ore as carbonate is changed to a metallic sulphide by the addition of sodium sulphide].—Mg. World Dec. 2 1916; p 946; pp 1; 10c.

—*Hulett Unloader as Applied to the Handling of Copper Ore*. [An excavator to handle the leached sands from the tanks at the plant of the New Cornelia Copper Co., Ariz.].—Mg. World Dec. 2 1916; p 951; pp 1*; 10c.

—*Leaching Tests at New Cornelia Plant, Arizona*. [Discussion by members of a previous paper].—A. I. M. E. Bull. Dec. 1916; p 2151; pp 8; 35c.

Metallurgy General

Bretherton, S. E.—*Electrolytic Practice*. [Correspondence speaking of previous penalizing for zinc in some ores and the doing away of this through the introduction of the electrolytic process developed by the Anaconda Co.].—M. & S. P. Dec. 2 1916; p 793; pp 2; 20c.

POWER AND MACHINERY

Electricity

Burch, H. Kenyon; Whiting, M. A.—*Automatic Electric Hoist at the Inspiration Mine, Arizona*. [Abstract of a paper read before the A. I. M. E. The hoist is driven by motors which are automatically driven].—M. & S. P. Dec. 2 1916; p 801; pp 534*; 20c.

Norman, Fred.—*Cadogan Power Plant*. [A small, compact plant using pickable refuse for coal. Alternating current is generated and transformed into direct current].—Coal Age Dec. 2 1916; p 928; pp 374*; 20c.

Root, W. A.—*Aspen, Over the Range in Pitkin County, Colorado*. [The history of the camp and several of the companies operating in it are included in the description].—Mg. World Dec. 2 1916; p 943; pp 234*; 10c.

Thomson, Leslie R.—*High-Tension Transmission Lines and Steel Towers*. [Deals with operating costs, loads on the towers, etc.].—Canadian Eng. Nov. 30 1916; p 445; pp 134; 35c.

—*Cap Lamp with New Feature*. [An electric lamp with a straight filament passing horizontally across the reflector].—Coal Age Dec. 2 1916; p 918; pp 174*; 20c.

—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Discussion of a paper by Herbert Haas].—A. I. M. E. Bull. 1916; p 2213; pp 9; 35c.

—*Equipment of the Valleyfield Colliery*. [Gives drawings and description of the steam-turbo and electric plants, besides a description of the coal washing plant and fan and boiler house].—Colly Guard. Nov. 17 1916; p 951; pp 214*; 35c.

Combustion Engines

—*Diesel Engines Versus Steam Turbines for Mine Power Plants*. [Discussion of a paper by Herbert Haas].—A. I. M. E. Bull. 1916; p 2213; pp 9; 35c.

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Developments in the copper market since our last report indicate that while a dull period is approaching the demand for copper holds to a good volume. Of course the business now appearing in the market consists of the odds and ends of covering operations by consumers, this being evidenced by the numerous small lot purchases. It is likely that by the 20th of the month the market will have finally reached a stage of inactivity. It may seem unusual, but copper factors are really welcoming the period of relief. What they have gone through since last August forms the basis for one of the most remarkable business records and, while it is manifest that along about next March another buying movement will set in, the exciting times that were had over the recent past will not be quickly forgotten. The orders are now written into the books. The business came voluntarily. It is now up to the sellers to make deliveries. Here is the real problem of the day. While it is certain that none of the producers oversold, it is conceded that they will have their hands full in making deliveries, unless by an unlooked for stroke of good fortune output of refined copper increases rapidly and attains what is now regarded dubiously, a total in excess of 200,000,000 lbs. a month.

The English government has made another ruling which to the uninformed, was likely to be misconstrued as being a bearish factor. The ruling is that all private buying of copper by English consumers must cease and that no copper shall hereafter be consumed in England except where permission has been granted. All this is simply a tightening of the regulations hitherto promulgated and instead of affecting the copper market will really benefit it, as buying of copper in England, instead of being conducted by many interests, will be wholly in the hands of the English government.

Trading in copper has become normal and no essential change has taken place in the price situation. Now that the end is approaching, it is noteworthy to state that there is a most unusual absence of bearish comment as to the situation. It would be indeed difficult, one may say impossible, to formulate a statement containing bearish observations on the copper situation, and while those interests who give vent to such comment at well-calculated moments in order to de-

press the market show great business acumen it is more than likely that they will now display shrewdness in maintaining silence at this time.

There have been some good sales of spot electrolytic at 35¹/₂ to 36 cts., with January sold at 35¹/₂ cts., and in one case 35³/₄ cts. was paid for January. For the first 3 months some blocks were sold for export at a flat price of 35 cts. f. a. s. New York, while domestic business was done at 34¹/₂ cts. December ordinary lake sold at 34¹/₂ cts., while some December casting fetched 34¹/₄ cts. Second quarter electrolytic sold at 33¹/₂ cts. No business for the third quarter has come to the surface in the past few days, with the quotation nominal at 32¹/₂ cts.

With stricter government regulations the London market loses what little potency it had as a market factor. On Monday of this week, when the new regulations took effect, the prices were dropped £3 to as much as £4, and it is manifest that the quotations are wholly nominal and represent the levels at which the government will sell copper to private consumers.

Quotations for copper per pound at New York for the week ended Dec. 13 were as follows:

Year

Tin.—Ever since the publication of the detailed tin statistics for November the market has been declining and the downward movement has been assisted by certain interests who are on the short side of the market, having made large future sales at prices 2 to 3 cts. below those now prevailing. Spot straits receded to 43¼ cts. and spot banka to 42½ cts. Very little business has been done either for spot or futures, with some spot holders eager to take profits.

Futures were quoted as follows: January arrival, 43 cts.; February, 42¼ cts.; March, 42½ cts.; April, 42½ cts., and June, 42½ cts. Limits from the east for April, May and June sailings were at 42¼ cts. London and Singapore dropped £4 last week, with irregular markets this week. Arrivals of tin since the first of the month total 650 tons, while 6253 tons are afloat to this country.

Quotations for tin per pound at New York and per ton at London and Singapore for the week ended Dec. 13 were as follows:

Dec.	New York		London	Singapore
	Spot.	Dec.	Straits, spot.	shipments.

Lead.—This metal assumed great importance in the past week, with a very active demand and prices rising steadily. Practically all of the independent sellers are booked full for December and in some cases for January. The advance to 7.50 cts. by the A. S. & R. Co. did not put that interest up to the level of outside sellers. A few weeks ago it was stated in this report that predictions of 8-ct. lead before the end of the year were being made. Lead for December delivery has already sold at 8¼ cts. New York, and January delivery has sold at 8 cts. Montreal. Predictions are now that 8½ cts. will be reached before the end of the year. Demand has been very active and, while a considerable business has been done, only a small part of the tonnage that buyers sought was satisfied. Demand has also been active for futures, some buyers being willing to take up to March delivery, but producers see a continued strong market and, while inclined to assist their regular customers, they are not letting metal get away from them in any too large quantities. The Australian situation is still commanding interest. While market factors are still dependent on mail advices from London, it is indicated that the situation down in Australia affecting the coal mines is serious.

As previously stated, spot lead sold at 8¼ cts. New York. January advanced from 7¾ cts. to 8 cts. New York and February from 7.60 cts. to 7.90 cts. New York. Very

little spot is to be had from first hands, while resellers are seeking a stiff premium. At London the situation continues unchanged.

Quotations for lead per pound at New York and per ton at London for the week ended Dec. 13 were as follows:

Dec.	New York		London

Zinc Ore.—Contrary to lead, zinc took a slight drop of \$5 for the better grades and \$10 for the poorer grades. This made the price range during the week at from \$85 to \$100. Shipments made during the week amounted to 20,263,790 lbs., valued at \$949,390, and this brought the total for the year to 674,022,937 lbs., valued at \$27,316,176.

Calamine.—This ore also had a drop in its price and sold at from \$53 to \$55. The week's shipments amounted to 587,110 lbs. and were valued at \$14,590. The year's shipments to date were 36,932,490 lbs., valued at \$1,097,669.

Spelter.—Liquidation by speculative interests has caused a recession in values of spelter, but despite the reaction producing interests maintain their optimism and assert

that the metal will sell higher. Buying on the decline has not been very brisk; in fact, very few of the offerings were taken up, which served to stimulate concessions. When the market at first began to fall off the charge was made that efforts to influence ore prices prompted the reaction, but this was shown to be false by the fact that producers were not sellers. The ore market, however, has not been affected by the condition of the metal market, a breakdown in the power plant at Joplin suspending operations. Last week sales of ore at Joplin amounted to about 10,000 tons, a record-breaking figure, and the price averaged \$100 a ton. Spot prime western metal eased off to 12 cts. New York and 11½ cts. St. Louis, while first quarter dropped to 11½ cts. St. Louis. Spot brass special receded to 13½ cts. St. Louis. No business was done in second quarter delivery. London declined last week, moving off £1 10s in spot and £3 10s in futures.

Quotations for spelter per pound at New York and per ton at London for the week ended Dec. 13 were as follows:

	New York.		London	
	Spot.		Spot.	Futures.
Dec. 7.	12.37½c		£58 0 0	£55 0 0

MISCELLANEOUS METALS.

Quicksilver.—The market holds steady at \$80 per flask for spot virgin metal. Supplies do not appear to be plentiful. One buyer who was in the market for 75 flasks reported being unable to secure that amount from any of the leading sellers.

Antimony.—Inquiries from munition makers have given greater strength to this metal, active negotiations having started on several hundred tons for delivery over the first half of next year. Spot metal is quoted at 14½ cts., duty paid, this price being applied to both Chinese and domestic brands.

Aluminum.—There has been no essential change in the situation, demand being fair, with the market holding steady and unchanged at 63 to 64 cts. for spot virgin ingots. No. 1 remelted is quoted at 58 to 60 cts. and No. 12 alloy at 45 to 46 cts. Sheet aluminum on 1917 contracts remains at 40 cts.

Pig Iron.—Developments continue along sensational lines, foreign and domestic buying being very large, with prices continuing upwards. Foundry grades are especially coming in for activity, foreign buyers taking about 13,000 tons and domestic buyers about 50,000 tons. Sales of 35,000 tons bessemer iron have been made to Italy.

Ferro-Manganese.—Some domestic makers have made sales of ferro-manganese as low as \$155 delivered, but in the east the market appears to be firm at \$164 delivered. Foreign makers continue to quote \$165 seaboard, but are not obtaining any contracts.

Tungsten.—An advance to \$20 per unit has been announced by the leading producers of tungsten following the clearing up of spot supplies. Demand continues active.

CHICAGO

December 23, 1916.

Minerals Separation Wins Supreme Court Decision Against Hyde

There is no doubt that the decision rendered by the U. S. Supreme Court in the flotation litigation is the most momentous ever rendered as concerns the world's mineral industry. The fact that the recent procedure of the court in giving out advance information of this kind was unusual, restrained our Washington representative from telegraphing the decision in time for last week's issue, under the belief that the printer's proofs were to undergo marked corrections.

The following is the official text of the decision given in its entirety, the incorrect version printed last week having been unauthorized:

In this suit the complainants, the first named as the owner and the other as general licensee, claim an infringement of United States letters patent No. 835120, issued on the 6th day of November, 1906, to Henry Livingstone Sulman, Hugh Fitzalis Kirkpatrick-Picard and John Ballot. The usual injunction, accounting and damages are prayed for. The District Court sustained the patent as to claims numbered 1, 2, 3, 5, 6, 7, 9, 10, 11 and 12; found that the defendant had infringed each of these claims, and granted the prayer of the petition. The Circuit Court of Appeals for the Ninth Circuit reversed the decree of the District Court and remanded the case with instructions to dismiss the bill. The case is here on writ of certiorari to review that decision.

As stated in the specification, the claimed discovery of the patent in the suit relates "to improvements in the process for the concentration of ores, the object being to separate metalliferous matter from gangue by means of oils, fatty acids, or other substances which have a preferential affinity for such metalliferous matter over gangue."

The answer denies all of the allegations of the bill and avers that in 25 designated United States and 5 British patents the process described in suit was "fully and clearly described and claimed," and it also avers that the claimed discovery was invented, known and used by many persons long prior to the time when the application was made for the patent in suit. Notwithstanding this elaboration of denial counsel for the defendant in the summarized conclusion to their brief rely upon only five of the many patents

referred to as showing that the patent in suit was anticipated and is therefore invalid for want of novelty and invention, viz: Everson (1886), Froment (Italy, 1902; Great Britain, 1903), Glagner (1903), Schwartz (applied for April 19, 1905, issued Dec. 19, 1905), and Kirby (applied for Oct. 17, 1903, issued Dec. 18, 1906). And the defendant, a man obviously experienced in the subject, says that, in his opinion, the whole basis of flotation concentration was disclosed in the Everson U. S. patent No. 348157 and in the Froment British patent.

It is clear that in the prior art, as it is developed in this record, it was well known that oil and oily substances had a selective affinity or attraction for, and would unite mechanically with, the minute particles of metal and metallic compounds found in crushed or powdered ores, but would not so unite with the quartz, or rocky non-metallic material, called "gangue." Haynes British patent (1860), and United States patents, Everson (1885), Robson (1897) and Elmore (1901). It was also well known that this selective property of oils and oily substances was increased when applied to some ores by the addition of a small amount of acid to the ore and water used in process of concentration. United States patents, Everson (1885), Elmore (1901), and Cattermole (1904).

Prior to the date of the patent in suit a number of patents had been granted in this and other countries for processes aiming to make practical use of this property of oil and of oil mixed with acid in the treatment of ores, all of which, speaking broadly, consisted in mixing finely crushed or powdered ore with water and oil, sometimes with acid added, and then in variously treating the mass—"the pulp"—thus formed so as to separate the oil, when it became impregnated or loaded with the metal and metal-bearing particles, from the valueless gangue. From the resulting concentrate the metals were recovered in various ways.

The processes, of this general character, described in the prior patents may be roughly divided into two classes. The process in the patents of the first class is called in the record the "Surface Flotation Process" and it depends for its usefulness on the oil used

being sufficient to collect and hold in mechanical suspension the small particles of metal and metalliferous compounds and by its buoyancy to carry them to the surface of the mixture of ore, water and oil, thus making it possible, by methods familiar to persons skilled in the art, to float off the concentrates thus obtained into any desired receptacle. The waste-material, or gangue, not being affected by the oil, and being heavier than water, sinks to the bottom of the containing vessel and may be disposed of as desired.

The process of the other class, called in the record the "Metal Sinking Process," reverses the action of the Surface Flotation Process, and is illustrated by the Cattermole U. S. patent, No. 777273, in which oil is used to the extent of 4% to 6% to 10% of the weight of the metalliferous mineral matter, depending on the character of the ore, for the purpose of agglomerating the oil-coated concentrates into granules heavier than water, so that they will sink to the bottom of the containing vessel, permitting the gangue to be carried away by an upward flowing stream of water.

The process of the patent in suit, as described and practiced, consists in the use of an amount of oil which is "critical" and minute as compared with the amount used in prior processes, "amounting to a fraction of 1% on the ore," and in so impregnating with air the mass of ore and water used, by agitation—"by beating the air into the mass"—as to cause to rise to the surface of the mass, or pulp, a froth, peculiarly coherent and persistent in character, which is composed of air bubbles with only a trace of oil in them, which carry in mechanical suspension a very high percentage of the metal and metalliferous particles of ore which were contained in the mass of crushed ore subjected to treatment. This froth can be removed and the metal recovered by processes with which the patent is not concerned.

It is obvious that the process of the patent in suit, as we have described it, is not of the Metal Sinking class, and while it may, in terms, be described as a Surface Flotation Process, yet it differs so essentially from all prior processes in its character, in its simplicity of operation and in the resulting concentrates, that we are persuaded that it constitutes a new and patentable discovery.

The prior processes which we have described required the use of so much oil that they were too expensive to be used on lean ores, to which they were intended to have their chief application, and the efforts of investigators for several years prior to the discovery of the process in suit had been directed to the search for a means or method of reducing the amount of oil used, and it is clear from the record that approach was being made, slowly, but more and more nearly to the result which was reached by the patentees of the process in suit in March, 1905. The Froment Great Britain patent (1903) and the Kirby United States patent (applied for in 1903 and granted in 1906) are especially suggestive of the advance

which was being made toward the desired result, but the Froment process was little more than a laboratory experiment, and has never proved of value in practice, and the Kirby process, though approaching in some respects more nearly to the end attained by the process of the patent in suit, found its preferred application in the use of an amount of oil solution equal to one-fourth to three-fourths in weight of the ore treated, which was prohibitive in cost.

Into this field of investigation at this stage of its development came the patentees of the patent in suit. They were experienced metallurgists of London, of inventive genius and with financial resources, and they entered upon an investigation of the processes of oil concentration of ores which was continued through several years, and consisted of a very extended series of experiments in which the quantities of oil, of water and of acid used and the extent and character of the agitation of the mass under treatment resorted to, were varied to an almost unparalleled extent as to each factor, and the results were carefully tabulated and interpreted. It was while pursuing a comprehensive investigation of this character, having, as the evidence shows, the special purpose in mind at the time to trace the effect on the results of the process of a reduction to the vanishing point of the quantity of oil used, that the discovery embodied in the patent in suit was made. The experimenters were working on the Cattermole "Metal Sinking Process" as a basis, when it was discovered that the granulation on which the process depended, practically ceased when the oleic acid (oil) was reduced to about 5% "on the ore." It was observed, however, that, as the amount of oleic acid was further reduced and the granulation diminished, there was an increase in the amount of "float froth," which collected on the surface of the mass, and that the production of this froth reached its maximum when about 1% or slightly less "on the ore" of oleic acid was used. This froth, on collection, was found to consist of air bubbles modified by the presence of the minute amount of oil used and holding in mechanical suspension between 70 and 80% of the total mineral content of the mass treated. It was promptly recognized by the patentees that this froth was not due to the liberation of gas in the mass treated by the action of the dilute acid used, and its formation was at once attributed in large part to the presence of the air introduced into the mixture by the agitation which had been resorted to to mix the oil with the particles of crushed ore, which air, in bubbles, attached itself to the mineral particles, slightly coated as they were with what was necessarily an infinitesimal amount of oil, and floated them to the surface. The extent of the agitation of the mass had been increased as the experiments proceeded until the "series of Gabbett mixers, fitted with the usual baffles, were speeded at from 1000 to 1100 revolutions per minute."

A careful consideration of the record in this case

convincing us that the facts with respect to the process of the patent in suit are not overstated by the plaintiffs' witness, Adolph Liebmann, an expert of learning and experience, when he says in substance:

"The present invention differs essentially from all previous results. It is true that oil is one of the substances used, but it is used in quantities much smaller than was ever heard of, and it produces a result never obtained before. The minerals are obtained in a froth of a peculiar character, consisting of air bubbles, which in their covering film have the minerals embedded in such manner that they form a complete surface all over the bubbles. A remarkable fact with regard to this froth is that, although the very light and easily destructible air bubbles are covered with a heavy mineral, yet the froth is stable and utterly different from any froth known before, being so permanent in character that I have personally seen it stand for 24 hours without any change having taken place. The simplicity of the operation, as compared with the prior attempts, is startling. All that has to be done is to add a minute quantity of oil to the pulp to which acid may or may not be added, agitate for from 2½ to 10 minutes, and then after a few seconds collect from the surface the froth which will contain a large percentage of the minerals present in the ore."

It is not necessary for us to go into a detailed examination of the process in suit to distinguish it from the processes of the patents relied on as anticipations, convinced as we are that the small amount of oil used makes it impossible that the lifting force which separates the metallic particles of the pulp from the other substances of it is not to be found principally in the buoyancy of the oil used, as was the case in prior processes, but that this force is to be found, chiefly, in the buoyancy of the air bubbles introduced into the mixture by an agitation greater than and different from that which had been resorted to before and that this advance on the prior art and the resulting froth concentrates so different from the product of other processes make of it a patentable discovery as new and original as it has proved useful and economical. It results without more discussion that we fully agree with the decision of the House of Lords, arrived at upon a different record and with different witnesses, but when dealing with the equivalent of the patent in suit, in *Minerals Separations, Ltd., v. British Air Concentration Syndicate, Ltd.*, 27 R. P. C. 33. In this decision Lord Shaw, speaking for the court and distinguishing the process there in suit especially from the Elmore oil flotation process which had gone before, but which was typical of the then prior art, said: "They (the patentees of the Agitation Froth Process of the patent in suit) are not promoting a method of separation which had before been described, but they are engaged upon a new method of separation. Instead of relying upon the lesser specific gravity of oil in bulk they rely upon the production of a froth by means of an agitation, which not only assists the process of the minute quantities of oil reaching the minute particles of metal, but forms a multitude of air cells, the buoyancy of which air cells, forming around single particles of the metal, floats them to the surface of the liquid."

And Lord Atkinson said: "In their process this mysterious affinity of oil for the metallic particles

of the ore is availed of, yet the oil is used in such relatively infinitesimal quantities that the metallic particles are only coated with a thin film of it, and the lifting force is found not in the natural buoyancy of the mass of added oil, but in the buoyancy of air bubbles, which, introduced into the mixture by the more or less violent agitation of it, envelop or become attached to, the thinly oiled metallic particles, and raise them to the surface, where they are maintained by what is styled the surface tension of the water."

The record shows not only that the process in suit was promptly considered by the patentees as an original and important discovery, but that it was immediately generally accepted as so great an advance over any process known before that, without puffing or other business exploitation, it promptly came into extensive use for the concentration of ores in most, if not all, of the principal mining countries of the world, notably in the United States, Australia, Sweden, Chile and Cuba, and that, because of its economy and simplicity, it has largely replaced all earlier processes. This, of itself, is persuasive evidence of that invention which it is the purpose of the patent laws to reward and protect. *Diamond Rubber Co. v. Consolidated Tire Co.*, 220 U. S. 428; *Carnegie Steel Co. v. Cambria Iron Co.*, 185 U. S. 403, 429, 430; *The Barbed Wire Patent*, 143 U. S. 275; *Smith v. Good-year Dental Vulcanite Co.*, 93 U. S. 486.

The claim that the patentees of the patent in suit are not the original discoverers of the process patented, because an employe of theirs happened to make the analyses and observations which resulted immediately in the discovery, cannot be allowed. The record shows very clearly that the patentees planned the experiments in progress when the discovery was made; that they directed the investigations day by day, conducting them in large part personally, and that they interpreted the results. *Agawam Co. v. Jordan*, 7 Wall. 583-603, rules this claim against the defendant.

Equally untenable is the claim that the patent is invalid for the reason that the evidence shows that when different ores are treated preliminary tests must be made to determine the amount of oil and the extent of agitation necessary in order to obtain the best results. Such variation of treatment must be within the scope of the claims, and the certainty which the law requires in patents is not greater than is reasonable, having regard to their subject matter. The composition of ores varies infinitely, each one presenting its special problem, and it is obviously impossible to specify in a patent the precise treatment which would be most successful and economical in each case. The process is one for dealing with a large class of substances, and the range of treatment within the terms of the claims, while leaving something to the skill of persons applying the invention, is clearly sufficiently definite to guide those skilled in the art to its successful application, as the evidence abundantly shows.

This satisfies the law. *Lovery v. Whitney*, 14 Wall. 620; *Ives v. Hamilton*, 92 U. S. 426, and *Carnegie Steel Co. v. Cambria Iron Co.*, 185 U. S. 403, 436, 437.

The evidence of infringement is clear.

While we thus find in favor of the validity of the patent, we cannot agree with the District Court in regarding it valid as to all of the claims in suit. As we have pointed out in this opinion, there were many investigators at work in this field to which the process in suit relates when the patentees came into it, and it was while engaged in study of prior kindred processes that their discovery was made. While the evidence in the case makes it clear that they discovered the final step which converted experiment into solution, "turned failure into success," (*The Barbed Wire Patent*, 143 U. S. 275), yet the investigations preceding were so informing that this final step was not a long one, and the patent must be confined to the results obtained by the use of oil within the proportions often described in the testimony and in the claims of the patent as "critical proportions" "amounting to a fraction of 1% on the ore," and therefore the decree of this court will be that the patent is valid as to claims No. 1, 2, 3, 5, 6, 7 and 12, and that the defendant infringed these claims, but that it is invalid as to claims 9, 10 and 11. Claims No. 4, 8 and 13 were not considered in the decrees of the two lower courts and are not in issue in this proceeding.

The decision of the Circuit Court of Appeals will be reversed, and the decision of the District Court, modified to conform to the conclusions expressed in this opinion, will be affirmed.

Dredging in Victoria.

The quantity of material treated during the year 1915 by dredging and sluicing in Victoria was 11,788,247 cu. yds. as against 13,979,606 cu. yds. in 1914, and the amount of gold won was 50,152 ozs., as against 56,796 ozs. in 1914. The yield of gold per cu. yd. of material treated was 2.0 grains. The total area treated was 365.8 acres, the ground varying in depth from 7 ft. to 75 ft., and the number of men employed was 923. The dividends paid were £30,842, the wages and other expenses amounted to about £148,538, and the initial cost of the plants was approximately £272,547. The quantity of tin won during the year was 87½ tons, valued at £8640. The total number of bucket dredges in operation was 42, against 45 the previous year; 17 pump hydraulic sluicing plants were in operation, contrasted with 21; there were nine jet elevators, compared with 13; 68 dredging plants were worked, against 79, and five hydraulic sluicing plants operated, against six the previous year.

True conservation is described by Dr. L. D. Ricketts as being an improvement of processes and an avoidance of waste.

Long-Wearing Roll Shells.

In the design and construction of crushing rolls, economy demands that the shell surrounding the core of the roll shall be able to crush a maximum quantity of rock to the pound of steel used up. Under present conditions it appears to be impossible for any mill to roll a steel shell of 24-in face, thereby making it necessary, where capacity is the object sought, to employ cast steel shells which are inferior in crushing life to the preferred roll steel shell. In order, therefore, that roll steel may be availed of, a splitting of the shell is necessary, so that the shell composed of two sections, separating along a plane parallel to the plane of rotation of the roll.

In a new type of shell recently suggested by Wallace N. Tanner of Anaconda, Mont., the separating

LONG-WEARING ROLL SHELLS.

plane of joint between the shell sections is located to one side of the center line of the roll, the object of this arrangement being to reduce the wear at the joint by enabling a pair of rolls to be assembled without having their joint planes coincident.

He also proposes a simple means of securing the shell sections to the core. As will be seen by the diagram, the core consists of two truncated cones mounted on the shaft with their bases together. The two sections of the shell are bored out so that their interiors correspond in contour to the face of the core. In assembling, wedge-shaped rings are forced in between the core and shell sections and drawn up by bolts as shown.

Air drill hose is often affected unfavorably by miners pouring oil in the hose itself before connecting to the drill machines.

Any manufacturer who spends money to promote his name must protect his integrity.

Activity in Goodsprings District, Nevada

W. A. SCOTT.

The numerous mines of Goodsprings district, Nevada, are located in Spring Mountain range, 25 to 30 miles in length. Goodsprings, the supply center for that region, is 12 miles westerly from Jean, a station on Los Angeles-Salt Lake railroad. The formation of this range consists of limestone, having numerous intrusions of igneous rock. The ore occurs on the contacts of different kinds of lime—blue, yellow and white. The bedding planes of blue lime dip about 34° west. Ore shoots also occur along breaks in the blue lime and in adjacent bedding. The gangue in shoots and veins consists of chert and altered limestone. The ore comprises zinc carbonate, silicate of zinc and sulphide of zinc, nearly all of which are accompanied by lead. In some veins the zinc and lead are segregated from each other.

The Boss mine has a lode carrying platinum in association with copper carbonate and gold; also in

35 to 40% zinc and 3 to 4% lead. Close to this is the Copper Peak, on the same contact as that of Ninety-Nine. The Copper Peak is owned by P. S. and W. E. McClanahan, H. L. Smith and R. W. Andrus. Shipments this year amounted to about 400 tons, which sampled 17% copper. Workings are by tunnels, and the ore has to be transported 1½ miles by pack animals to the beginning of wagon haulage.

The Christmas, situated at the south end of the range, and controlled by Joseph Doran, Fred Hale, Erick Zenezn, and others, will soon have its mill, with Stebbins dry concentrators, ready for operation. The ore carries zinc and lead and is medium grade.

Monte Cristo, said to have been the earliest zinc producer in the Goodsprings district, is in the hands of lessees who are mining and shipping a car per month of high-grade ore.

Bullion mine, a mile south of Monte Cristo, is

THE TOWN OF GOODSPRINGS.

THE YELLOW PINE MILL.

large seams of plumbo-jarosite, containing palladium and gold.

The mill being erected is to put into effect a modified chlorination process, developed by R. J. Goodwin, metallurgist. The plant contains a crusher and rolls, and a Holt-Dern roaster, and has a daily capacity of 10 tons. Those in control of the property are S. E. Yount, O. J. Fisk, H. White, and others. The presence of platinum in Boss ores was discovered by Harry K. Riddall, assayer and metallurgist, now at Yellow Pine mine and mill. The Boss is about 10 miles from Goodsprings.

Ninety-Nine mine, owned by J. B. Jenson, is a copper producer. During 1916 the ore shipments have averaged 80 tons per month, running 6 to 24% copper. One stope yielded 1200 tons of ore sampling 15%. Most of the ore is oxidized, and is hoisted from a 400-ft. shaft.

The Contact mine, owned by A. L. Chaffin, Goodsprings, produces the zinc ores typical of the district. Ore shipments amount to 100 tons per month, running

owned by J. J. Daynes, C. E. Jenkins, and others, and is under the management of Thos. Varden. A mill of 35 tons capacity, equipped for crushing, pulverizing, and dry concentrating by Stebbins tables, is being operated. October shipments of concentrates consisted of 3 cars running 70% lead, and 3 cars sampling 40% zinc.

In this vicinity is the Anchor mine, operated under direction of Roy Moon. Included in the equipment is a half-mile tramway and a dry concentrating mill. Frank A. Keith, Los Angeles, is one of the owners.

The New Year, 12 miles south of Goodsprings, belongs to the Campbell estate, and has been worked profitably by leasers during last 2 years. One lease to Bert Whitney is producing 200 tons per month of zinc ore of good grade. A second lease to Springer & Frederickson has been producing 75 tons of zinc and 40 tons of lead ore per month.

The Yellow Pine Mining Co. produces about 2700 tons of ore per month, of which 900 tons are shipped

crude and 1800 tons are concentrated before shipping. This is not only a big producer, but a steady dividend payer. The mill is situated at Goodsprings, the mine is 4 miles to the southwest, and the two are connected by a narrow gauge railway for ore haulage. The mine is opened by a 900-ft. inclined shaft in which skips are operated. A Fairbanks-Morse 75-hp. semi-Diesel oil engine operates a generator, the current from which operates the hoist and air compressor. The mill is equipped with a crusher, rolls, jigs and tables. The mill heads run 31 to 33% zinc, and 12 to

ore of profitable grade is exposed all the way down.

The Sultan, 8 miles southwest, owned by Henry Robbins, Goodsprings, is a producer of zinc-lead ore. A mill equipped with Stebbins dry concentrators, having capacity of 30 tons per day, is operated chiefly to separate the lead from the zinc. The Mongolian group, near Sultan, belongs to the A. E. Thomas estate, and is under lease and bond to R. Puelz, who is shipping 20 tons per month of zinc carbonate, running 40% zinc.

The Bill Nye, owned by Wm. Allen, Goodsprings,

THE BULLION MILL.

THE SULTAN MILL.

17% lead. About one-third ounce silver is obtained from each 1% of lead. This ore comprises both sulphide and carbonate. The work here is not only a method of concentration but of separation by gravity. The president of the company is J. F. Kent; secretary Fred A. Hale, Jr.; S. E. Yount and R. B. Chapman are directors and stockholders. J. O. Kemple is mine superintendent, T. J. Renaux being in charge of the mill.

Keystone mine, 7 miles west of Goodsprings, is said to have been located in 1888, and it is claimed it has produced \$500,000 in ore. It is operated under lease by Geo. Rose, who is developing and building a mill for concentrating a lot of ore in an old dump. The shaft has a depth of 700 ft., and it is said oxidized

is a small, steady shipper of ore running 40% zinc. The Frederickson, owned by Munzberg & O'Kelly, is mining and dry-concentrating a small tonnage of zinc-lead ore. The Columbia Copper, Jos. Diederich, owner, has a 1200-ft. tramway, ore bins and a gasoline hoist, and is producing a small tonnage.

The Potosi, in northern part of district, was located in 1852, and is now operated by Empire Zinc Co., which produces about 1200 tons of zinc-lead ore per month. The ore is said to run 35 to 45% zinc. The mine is worked through tunnels, and ore is delivered to loading bins by a 2500-ft. tramway. The ore is shipped to Arden station. The Dawn, operated by A. Muncabrock, has shipped some zinc-lead ore, and has shown some molybdenite in the same vein. The Red

Cloud is opened by a 300-ft. shaft and has produced some gold that was extracted by cyanidation. It belongs to J. Armstrong and John Loup, of Long Beach. The Pilgrim is now active. It is owned by Henry Robbins and Harvey Hardy.

Yellow Pine Extension Co. owns the Alice copper and zinc mine, adjoining Yellow Pine mine on the south. It is being further developed from a 700-ft. inclined shaft. The company is controlled by A. J. Robbins, Geo. A. Fayle, Goodsprings, and E. B. Critchlow, Salt Lake, and M. M. Miles and A. J. McDermott, Los Angeles. About 100 tons per month of zinc ore is being shipped. The Prairie Flower, half a mile north of Yellow Pine, is being developed by Fred Hale, who has it under bond. Incidentally it is a small producer of zinc-lead ore. The Oro Amigo, $1\frac{1}{2}$ miles from the Boss mine, is owned and is being developed by S. E. Yount. High grade ore, carrying gold and platinum, has been found.

Other properties being developed comprise the

fore Jan. 1. In the meantime, this company has contracted for the delivery of 5000 to 6000 tons of ore per month from the district, which includes both lead and zinc ores. A custom concentrating plant is also to be built at Goodsprings by those who control the sampler. It is to have a capacity of 50 tons per day, and will be equipped for wet concentration. This will facilitate the marketing of ores from Yellow Pine district,

THE COPPER PEAK MINE.

THE ANCHOR MILL.

Hoodoo, owned by Frank Williams, who has mined and shipped ore running 40% zinc and 60% lead; the Root Zinc Co., operating on Bonanza hill, is mining and shipping about 10 tons per day of zinc-lead ore, and will construct a 1700-ft. aerial tramway to carry the ore to the loading bins; the Singer, in the hands of lessees, is mining and shipping small lots of ore; the Whale has considerable low-grade ore developed, and has put in a gasoline-driven compressor for drill work; the Milford and Addison groups have been producing 4 years; the Ingomar, 30 miles from Goodsprings, and 16 miles from Roach station, is a steady producer of lead and zinc; the Green Monster, belonging to the Hearst estate, is active, under management of C. B. Neel.

The Goodsprings Sampling Co., managed by J. B. Jenson, has about completed a sampling plant of 20 tons capacity at Jean station. This plant has a Wheeling crusher, three sets of Traylor rolls, a 200-ft belt conveyor, a 28-hp. Western gas engine, 100-ton track scales, and a 225-ft. ore platform, as well as ore bins. This plant was expected to be ready for operating be-

as it is stated on good authority that 70% of the ore available in the mines is of milling grade, and needs concentrating before shipping to market. Part of this is zinc carbonate that has been sorted from the lead ore. The zinc ore produced here is mostly carbonates, silicates and oxides. The lead ores are half carbonate and half sulphide.

During the first 6 months of 1916 the shipments of high-grade ores from the district averaged between

THE YELLOW PINE MINE.

5000 and 6000 tons per month, which did not include Potosi shipments and others from the north end of the district, amounting to 1200 to 1500 tons a month.

The supply of selenium is obtained almost wholly from working the residues of electrolytic copper plants and the flue dust in sulphuric acid chambers.

A special steel of great importance to the electrical industry is silicon steel, used in electrical transformer construction and all alternating-current apparatus.

Underground Electric Mine Lighting

· LETSON BALLIET.

Underground lighting in mines has been viewed from various angles, and at the present time there are several methods in use. There is the open oil lamp, the Davy lamp, the candle, the carbide lamp, and the electric battery lamp fitted to the miner's cap. Electric lights are now quite commonly used in underground lighting.

The particularly advantageous feature in wiring a mine to have it well lighted throughout is the safety it provides by having all parts of the mine permanently lighted, so that the workman may see where he is going, but the comparative value of electric lights over hand lights has never been extensively discussed.

There are a few who contend that electric lights will not give any indication of bad air, while a candle or an open flame will go out and warn the miner of the danger. This argument can be met with the answer that if you suspect bad air you can have an open flame for indicator.

"How much does it cost you for electric lights in the Buckeye mines?" I was asked.

Well, we will take one drift in this mine to give you some actual comparative figures. We have a long drift in one level that is 1200 ft. long, two upraises that are working from that level. From the station to the breast, and up the manway of the upraises, we have electric light globes, protected by wire guards, to within about 50 ft. of each face. There are 32 lights on this circuit, at varying distances from 50 to 75 ft. apart, depending on turns or conditions. The circuit is equipped with 40-watt incandescent tungsten globes. Each working crew is provided with an extension cord with a lamp on the end of the cord, also protected by wire screen guard. With this extension cord he makes a connection at the nearest light socket to where he wants to work, strings the cord back out of the way, and carries the globe to his working face and hangs it up behind him. In this way the entire working place is flooded with light. He is a two-handed man, and does not have to bother with his light again until he is through with his shift and ready to blast. Then he carries out his light and winds up his extension cord and puts it in a safe place. Altogether, there are thirty-eight 40-watt tungsten globes burning in this drift and the upraises. This consumes 1500 watts on the meter every hour, which costs us $4\frac{1}{2}$ cts. an hour, or 35 cts. per 8-hour shift for the drift. There are eight men employed in this drift on the working faces connected with it, including the trammers; thus the electric lights cost us $4\frac{1}{2}$ cts. per shift per man, in this drift. If we had 20 men working in this part of the mine the lights would cost us about 2 cts. per shift per man.

The efficiency of this method of lighting is shown in the fact that when a man walks through a drift he walks at his natural speed, and is not groping his way in the dark, or trying to protect his lights from draughts or wind. The lights never go out and no time is lost adjusting them or handling them. The man is two-handed and works with the same physical efficiency that he would work on the surface or in a factory that was well lighted, and the actual results obtained in this mine show that the men accomplish 33% more work when the mine is electric lighted throughout than when working with hand lamps.

The cost of the operations in this drift are at the present time \$2000 a month, including miners' wages, supplies and its proportion of the overhead expense. As the progress and actual results obtained in this drift are 33% more than they were with any form of hand light, we find that we accomplish exactly as much in 3 months as we previously accomplished in 4 months, and therefore we have saved the entire operating expense of one month every quarter of a year; or to continue the same basis, we accomplish exactly the same in 12 months as we did accomplish in 16 months with the hand lights. Therefore we find that \$2000 a month for 4 months, which we have saved, would aggregate \$8000, and show that by using electric lights throughout the working places in the mine that we save \$8000 a year over any form of hand lights that we know about. Other levels, crosscuts and drifts show the same proportionate saving, and these figures are carefully compiled every month and have been for the last 3 years.

You could not induce us to go back to hand lamps, nor do the miners working in the mine wish to go back to hand lamps. The hand-lamp method of lighting is just as obsolete from an efficiency standpoint as the hand drill is when compared to the pneumatic drill.

Our men always have a candle or two in their box somewheres near at hand, so that they can light it when they wish to "spit" their fuse, or if by any chance the wires should be broken and the lights go out they can find a candle to come out of the mine, or if they suspect any gas they can light a candle and test it, but they don't work by it, and don't want to work by it.

Iron combines with all non-metallic elements, generally forming two or more distant compounds with each. It is dissolved by all the mineral acids with which it forms well-known salts.

There are two general methods employed in the manufacture of sulphuric acid, namely, the "contact process" and the "lead-chamber" method.

Tom Reed Gold Mines Property, Arizona

C. F. SPILMAN.

The Tom Reed Gold Mines Co. has opened an entirely new mine in the southerly end of its extensive estate which bids fair to give forth a golden stream of bullion far in excess of the wonderful production of the past 7 years. Because development has not been carried far enough to determine the size and value of the big vein that has been opened through shafts on the Black Eagle, Bald Eagle and Aztec Center claims, the management until now has made no official report of conditions. That the work finally has been carried to a point that makes sure the existence of a huge deposit of gold ore is demonstrated by the action of

Reed is entering an era in its history that will long be remembered by the stockholders because of its production and high earnings. President Moerdyke states that the ore body has been proven from the Bald Eagle shaft in a southeasterly direction for 1100 ft. to a point well beyond the Aztec shaft. The Bald Eagle shaft workings at a depth of 200 ft. cut 33 ft. of vein matter of which 26 ft. is quartz assaying \$9 to \$10 per ton. Before this work was done a shaft was sunk on the Black Eagle claim 1500 ft. distant and a crosscut driven to the east, intersecting the vein in the Aztec Central S. E. claim. Here at a depth of 400

TOM REED GOLD MINING CO.'S SURFACE PLANT, OATMAN, ARIZ.

the directors, who have authorized Superintendent Rabb to start construction of an addition to the mill which will double the capacity of the present reduction works. The new unit, which will increase the capacity to 250 to 300 tons per day, will be completed in 6 months and the company will then be able to treat a large tonnage of ore averaging around \$12 to \$15 per ton at a handsome profit. Mine and mill costs in the old mill, which employs stamps in crushing, are under \$6, and this cost will be materially lessened with the new machinery in operation. In fact, it is not improbable that \$5 ore will be treated at a profit.

President Moerdyke and Vice-President Mushrush spent a week at the mine and examined all the workings. They left firm in the conviction that the Tom

ft. a drift was driven back toward the Bald Eagle shaft. This drift soon entered a shoot of good ore in a big, strong vein. A shaft was then started near the center of the Aztec Center claim, which sidelines the Bald Eagle, known as the Aztec shaft, which now is the center of operations. At a depth of 400 ft. a crosscut from the Aztec shaft entered the vein and was extended to the footwall through 18 ft. of ore. The first 12 ft. on the hanging wall side of the vein averaged \$8.50, the 6 ft. on the foot wall \$14.50. A drift was driven along the foot wall for 350 ft. face samples across the 6 ft. broken by the drills running as high as \$50 and the average well up into good mill values. Shaft sinking was resumed and the shaft is now well into the vein at 470 ft. The quartz is 10 ft. in

width and assays \$13.88. An ore bin has been built at the Aztec shaft and preparations made to transport the ore to the mill by auto trucks whenever it may be needed. Eventually an aerial tramway will be constructed.

The Aztec workings are about a mile southeast of the main working shaft and mill. Intervening between the Bald Eagle workings and the main workings is the Gray Eagle claim, which also has great possibilities.

In the older workings of the Tom Reed, conditions are excellent, and there is no difficulty in supplying the mill with 140 tons per day. What is known in Tom Reed nomenclature as the No. 3 ore-shoot has been opened on the 1400 level for a distance of 75 to 100 ft. and is being stoped for a width of 5 to 6 ft., producing ore of good mill value. Lenses of high-grade ore are not infrequently encountered in the mine, and the richer ore is fed in with that of lower grade, bringing the average mill feed up to about \$15 per ton. The mill is treating 140 tons per day.

The Tom Reed mine has had a spectacular career, and for the past 7 years has produced an average of \$750,000 gold yearly. The company has produced \$5,833,702 from the start of operations up to April 1, 1916, and has paid dividends aggregating \$2,528,648, or \$2.75 per share. The bullion production for the fiscal year ending March 31, was \$658,848 from which the directors paid dividends of \$163,719. This left \$197,786 cash on hand April 1, insuring ample funds for the construction of the new addition to the mill. As the company probably is earning more than \$1000 per day, the treasury may not be greatly depleted by the cost of new construction, and dividends may be resumed at a very early date.

A significant feature of Tom Reed development is the fact that the ore bodies have not been exhausted at 1400 ft., proving that the big veins of the Oatman district are deep-seated. There are lean places, it is true, and places where the ore channel contracts, but the average size and average values are unusual and found in few gold fields anywhere.

An Exhaustive Study of Zinc.—Recognizing that there is an insufficient knowledge of the properties of zinc, the U. S. Bureau of Standards has undertaken an investigation which it proposes to have carried out with thoroughness. Specimens have been prepared for tests of the metal in tension, torsion, transverse, cold bend, compression, shearing and hardness. Considerable progress has also been made in the investigation of testing methods for galvanized materials, which has been carried out in co-operation with the American Society for Testing Materials, several manufacturers furnishing the samples.

Good health is one of the first requisites for the efficiency of labor, for more and better work can be done by strong, well men than by those who are sickly.

Weston Portable Electro-Dynamometer Voltmeters.

Problems hitherto considered impossible of solution have been solved in the designing of these Weston instruments. They are instruments of precision adapted to use on A. C. or D. C. circuits. Guaranteed to an accuracy of one-fourth of 1% full scale value, of any frequency to 133 cycles per second, and any commercial frequency even as high as 500 cycles per second with very slight error. Double ranges are furnished in all instruments of this model.

Their movable systems have an extremely low moment of inertia and are very effectively damped.

MODEL 341.

Indications are independent of room temperature, the heating effect of current passing through the windings, and the instruments are shielded from external magnetic influences.

The scales are $5\frac{1}{4}$ in. long. Owing to the principle of operation these instruments cannot be made with scales that are uniform throughout their entire length, but the upper four-fifths portion of the scale is remarkably legible and uniform. Each scale is hand-calibrated and is provided with a mirror over which the knife-edge pointer travels and the pointers are equipped with a simple zero setting device.

Railroad's Use of Fuel Oil.—It is estimated consumption of fuel oil by railroads of Texas and Louisiana for 1916 will run close to 11,200,000 barrels, compared with 11,020,259 for 1915. The greatest consumer of this fuel in the two states is Southern Pacific. Last year its system in Texas and Louisiana used 4,454,899 barrels and this year consumption will be nearly 5,000,000 barrels, it is stated. Santa Fe was the second largest consumer of fuel oil, it having burned 2,357,460 barrels last year. Southern Pacific's subsidiary steamship line, operating between Galveston and New York, used 307,542 barrels of heavy Mexican oil for fuel last year. Southern Pacific is obtaining a considerable supply of fuel oil from its subsidiary, the East Coast Oil Co., which has extensive oil producing holdings in the Tampico region. It is reported Santa Fe plans to enter the Mexico oil producing fields when conditions in that country become more settled.

Swivel Connection for Oil Well Ropes. New Northwest Station of the Bureau of Mines.

Oil well pumps are operated by means of a wire rope extending to the bottom of the well. A swivel is inserted at a point near the weights, used for holding the rope taut, to permit the latter to twist freely. As the usual diameter of the swivel socket is only about $1\frac{5}{8}$ ins. it is difficult to obtain sufficient wearing surface for the different parts of the swivel, and as a consequence the latter wears out rapidly due to the heavy pressure on these small surfaces.

Henry B. Walker, Lancaster, O., has invented a

SWIVEL CONNECTION FOR OIL WELL ROPES.

swivel socket which is shown in the illustration. This has a number of bearing surfaces in series, which between them absorb the pressure and give free movement and a long life to the socket.

At the lower end is seen a mandrel and coupling. Above this is the rope end, enlarged in the usual manner. Surrounding both mandrel and rope end is a split shell, its upper interior bowed out to receive the rope end and its lower interior formed with bearing surfaces to fit the shoulders on the mandrel. Nuts on each end hold the two halves of the shell together.

The mining and metallurgical experiment station for the Pacific northwest states and the coast regions of Alaska, which was recently established at the College of Mines, University of Washington, Seattle, by Secretary of the Interior Franklin K. Lane, will be opened on Jan. 1, 1917. Dorsey A. Lyon, who has been superintendent of the Salt Lake station, spent Dec. 6 and 7 at Seattle making preparations for the opening of the station.

The principal investigations of the new station, for the immediate future, will be in electro-metallurgy, which is the specialty of Mr. Lyon, the superintendent. He will be assisted by two other experts in the subject and a junior chemist. The electric furnaces will be located in the present College of Mines laboratories and all work will be done in cooperation with the college. Coal washing and mining

BUILDING DONATED TO THE BUREAU OF MINES, SEATTLE.

will be in the hands of a mining engineer, George Watkin Evans, of Seattle. The whole staff, to be assigned to the station in the near future, will number 9 men.

The Bureau of Mines station will be housed in a building of its own, which will serve as headquarters for all operations of the Bureau within the Pacific northwestern states and the coast regions of Alaska. The Bureau has maintained a mines rescue station at the College of Mines since 1910, where nearly 800 men have been trained. Co-operative work will be carried on by the Bureau with the Oregon State Bureau of Mines at Corvallis and the University of Idaho at Moscow.

Money invested in fresh air, good light, pure water and generally clean conditions will return good interest in the shape of increased labor efficiency.

The maintenance of working conditions such as will not menace the health of the worker is to be desired in all occupations.

What the Mining Companies are Doing

American Smelting & Refining.

Earnings on American Smelting & Refining common for six months ending Dec. 31 are expected to amount to fully \$20 a share. That would bring common share earnings for the year to about \$37 a share, earnings for first half year having been over \$16.

These large earnings for current half year are due to higher prices for copper and greater volume of metal turned out from smelters and refineries.

Capacity is booked up for first half of 1917, including additional refinery capacity to be brought in next month. Indications are, therefore, that in six months to June 30 next American Smelting will earn between \$25 and \$30 a share for the common. Continuance of the war through next year would probably result in earnings for the common for the 12 months of between \$50 and \$60 a share, making common share earnings for this year and next year combined between \$87 and \$97 a share.

Chile Copper Co.

The Chile Copper Co. produced 4,098,000 lbs. of copper in November. We compare production for 1916 (in pounds) as follows:

January	2,066,782
February	3,144,480
March	3,536,796
April	3,702,327
May	3,664,000
June	3,610,000
July	3,574,000
August	3,020,000
September	4,038,000
October	4,542,000
November	4,098,000

Arizona Copper Co.

Arizona Copper Co. produced 4,380,000 lbs. of copper in November, which compares with previous months as follows:

	1916.	1915.	1914.	1913.
January	*	3,632,000	3,474,000	3,100,000
February	2,414,000	3,200,000	3,062,000	3,000,000
March	3,510,000	3,540,000	3,284,000	3,200,000
April	5,140,840	4,200,000	3,570,000	3,100,000
May	4,900,000	3,516,000	3,092,000	3,200,000
June	4,800,000	3,674,000	3,742,000	3,000,000
July	4,400,000	3,390,000	3,300,000	2,600,000
August	4,800,000	3,600,000	3,738,000	1,800,000
September	4,180,000	*1,552,000	2,408,000	1,880,000
October	4,900,000	†	2,406,000	3,550,000
November	4,380,000	†	2,402,000	
December		†		

*Idle because of strike. †Closed.

Butte & Superior.

The Butte & Superior Mining Co. mined during the month of November 54,312 tons of ore and milled during the same month 53,880 tons from which 14,300 tons of concentrates were realized. The concentrates assayed 53% in zinc. The recoveries were 93.7%. The total amount of zinc in concentrates estimated was 15,158,000 lbs. In October the total amount of ore mined was 51,450 tons with an assay of zinc in concentrates of 52.72% and recoveries of 92.5%. The total zinc in concentrates realized in October was 15,694,000 lbs.

The November showing was relatively a little better than that of October as the month had one less day in it and in addition had election day and Thanksgiving Day.

The month was one of the best in the history of the company and the advancing price of spelter promises to make the last quarter of 1916 one that will roll up good earnings. Butte & Superior Co. is selling its concentrates now direct to the smelting companies with the exception of a small part that it sells as spelter.

The production of silver for the month amounted to 312,000 ozs. or slightly less than that for October. With silver

selling above 75 cts. an oz., the silver production has become quite an item in the monthly earnings.

The production of spelter by the Butte & Superior Co. for the third quarter of this year was greatly curtailed by the accident at the Black Rock mine and its profits were also greatly reduced by the low average price of spelter which was about 8½ cts. per lb.

Granby Con. Co., B. C.

Granby Con. Mining, Smelting & Power Co. is earning at the rate of about \$66 per share. This is on the basis of 29-ct. copper. It is expected, therefore, that Granby will increase its present quarterly dividend rate from 2 per cent to 2¼% at its meeting December.

Anyox production at the present time is a little less than 3,100,000 lbs. per month, or at the rate of 37,000,000 lbs. annually, while at Phoenix the output of about 1,275,000 lbs. per month is equal to about 15,300,000 lbs. annually. Total output of the company, therefore, is at the rate of over 52,000,000 lbs. of copper per annum.

The cost of production at the Hidden Creek property is about 9 cts. per pound compared with 15 cts. at the "Old Granby" or Phoenix property. Earnings at Hidden Creek, on 29-ct. basis, are at the rate of \$7,500,000 annually and at Phoenix \$2,500,000, making Granby's earnings at the present time at the rate of \$10,000,000, or above \$66 per share on the 149,985 shares of outstanding capital stock.

Utah Metal & Tunnel, Utah.

The Utah Metal & Tunnel Co. for the 9 months ending Oct. 1, 1916, earned profits of \$567,737. The company's bonded indebtedness has been reduced \$145,000, leaving outstanding \$229,500.

The combined statement of the company and the Bingham-New Haven for the above period shows as follows:

Income—		
Gross value ore mined.....		\$1,262,752.09
Income from other sources.....		37,161.57
Total income.....		\$1,299,913.66
Expenses—		
Smelting charge.....	\$	315,282.09
Mining.....		194,325.55
Development.....		106,582.90
Hauling.....		6,293.24
Lease ore.....		18,150.95
Milling.....		46,497.65
Selling, administration and general expense.....		45,044.17
Total expenses.....		\$ 732,176.55
Operating profit.....		567,737.11
Current cash assets—		
Cash.....	\$	497,677.38
Due from ore.....		176,104.21

Gold.....	\$19.50 per oz.	\$319,334.84
Silver.....	61.05 cts. per oz.	204,545.08
Copper.....	26.40 cts. per lb.	393,630.70
Lead.....	6.90 cts. per lb.	345,241.47
Average Costs—		
Mining.....		\$2.42 per ton
Milling.....		1.01 per ton

Standard Silver-Lead, B. C.

According to a statement issued by the company there was an operating loss in October of \$1,111 as compared with an actual operating profit of \$17,785 in September, \$137,637 in March, \$88,008 in April and \$40,968 in May. There was an actual operating loss of \$12,738 in February.

Among other things the loss results from a reduction in the receipts on preliminary shipments, which were \$26,386 in October as compared with \$33,055 in September, and a reduction in the zinc sales which were \$8503 in October as compared with \$17,137 in September.

The surplus at the end of October was \$202,669 as com-

pared with \$264,319 at the end of September. The receipts for October were \$46,670 as compared with \$61,149 in September, \$18,824 in February, \$180,943 in March, \$131,309 in April and \$88,227 in May.

The disbursements for production, tramming, milling, power, shipping and selling, taxes, insurance, casualty insurance, salaries and general expenses were \$37,114. They differ little from those of any other month except February, for which they were less. These figures show a relative operating profit of \$9555 in October as compared with \$24,188 in September, \$143,065 in March, \$93,542 in April and \$55,443 in May. There was a relative operating loss of \$8743 in February.

Disbursements in October for development, construction, work in the Aylard and No. 7 tunnels and store supplies were \$10,867, which is higher than some months and lower than others of the current year.

At the last regular monthly meeting the directors decided to pay all future dividends quarterly on account of the long distance from the transfer office and the great amount of detail connected with monthly disbursements.

Shannon Copper, Ariz.

Shannon November output of 926,000 lbs. of copper compares as follows with previous months:

November	926,000	June	994,570
October	757,000	May	1,072,000
September	744,000	April	982,000
August	925,000	March (24 days)	682,000
July	968,000	February (16 days) ..	666,000

Miscellaneous Reports.

The September report of the Iron Cap Copper Co. shows as follows: Receipts, \$14,192; expenses, \$21,938; loss, \$7746. A new hoist paid for was included in the expenses.

Plans have been tentatively outlined by the management of Consolidated Nevada Utah Mines & Smelters Corporation to offer holders of the \$500,000 outstanding 6% first mortgage bonds preferred stock, dollar for dollar, with a bonus of common stock. This would eliminate a fixed charge of \$30,000 per annum. Earnings are said to be running at the rate of \$15,000 monthly, or between \$150,000 and \$200,000 net per annum.

Ohio Copper Co. of Utah has taken over all properties of the Ohio Copper Mining Co. through transfer of deeds to new company. The Ohio Co. of Utah has paid all debts and liabilities of its predecessor company, totaling over \$1,500,000. Acting under order of the U. S. District Court, trustees in bankruptcy of the Ohio Copper Mining Co. have surrendered to the Empire Trust Co. all books and deeds of the company. Stockholders can now obtain transfer of their stock.

The Shannon Copper Co. recently sold 300,000 lbs. of copper for April, May and June delivery at 34 cts. a pound. This is a full 7 cents a pound more than the average price secured by Shannon for its copper in the first 10 months of this year, the average to the end of October being about 27 cts. a pound. About three-quarters of Shannon's production is now sold up to the end of June and 50% sold up through July, August and September. It has also sold some copper for delivery as far ahead as next October, November and December at highly satisfactory prices.

The Calumet & Arizona Mining Co. has secured favorable options on 70% of the stock of the Gadsden Copper Co. in the Jerome field, Arizona. The Gadsden Co. is a new corporation, organized under the laws of Delaware with an authorized capitalization of a million shares, par value \$1; 300,000 shares are issued to pay for the property, the balance being optioned to the Calumet & Arizona Co. The properties cover approximately 25 claims, some patented and others unpatented, on the southern extension of the fault upon which the United Verde's ore body is found and immediately adjoining the property of the United Verde. The obligation of the Calumet & Arizona, under its option, is the sinking of one shaft and doing other exploratory work which is to be done

under the direction of the company and for which the company receives stock in the Gadsden Copper Co. These expenditures will approximate about \$10,000 per month, the Calumet & Arizona being obligated to spend \$100,000 in the explorations, with the right to discontinue work at any time after that amount is expended if, in the opinion of their engineers, further expenditures would be wasted.

The St. John Del Rey, the deepest metal mine in the world, continues to do well. The bottom remains at 5826 ft. vertically below the surface. The company has just issued its 85th annual report. During the year ended February, 1916, the mine produced 192,500 tons of ore yielding £475,134 worth of gold, or £2 9s. 4 d. per ton, earning a profit of £160,733. Owing to the step-like succession of shafts and levels, the poor ventilation is an obstacle to deeper exploration. The temperature at the bottom is 104° F. George Chalmers, manager, intends to use a cooling and drying equipment for improving the air, expecting thereby to render conditions more comfortable for the miners underground.

An increase from \$6 to \$8 annual basis is expected next month when directors of the Miami Copper Co. meet for action on the first dividend to be paid in 1917. Such a step would be conservative as Miami's earnings, even on a 9-ct. average cost, would be almost double the dividend requirements at the new rate. The company's production in November, a 30-day month, was on the basis of better than 5,100,000 lbs. for a 31-day period, and was proportionately greater than the October yield of 5,054,153 lbs., which was a record. The coming year has much in store for Miami, as with the consummation of plans in mind the output toward the end of 1917 will have been increased to a basis of about 70,000,000 lbs. of copper.

The Superior & Boston Copper Co. reports for the year ending Sept. 30, 1916 as follows: Receipts, \$283,531, plus balance Oct. 1, 1915, \$29,529; total, \$313,060; expenditures, \$136,953; balance on hand Oct. 1, 1916, \$176,107. President Rice says in part: Development and mining operations are going forward at and above the 800 level and the grade of the ore and tonnage being mined show steady improvement so that it is the belief of our superintendent that we will soon have openings enough in ore, in the upper levels, to maintain a production that will meet our regular mine expenses, and with the development of sulphide ores on the 1300 and 1400 levels, our mining operations will assume a substantial and profitable basis.

With practically unchanged tonnage of ore treated, except for the drop occasioned by one less day than in October, the production of Inspiration Con. Copper during November receded to 10,600,000 lbs. of copper. Slightly lower copper values in the ores treated last month caused the smaller output of copper as the management mines the ore as it comes and makes no selection whatsoever. A production of between 10,500,000 and 11,000,000 lbs. of copper a month represents normal conditions at Inspiration with its present facilities. A higher grade of ore with a big tonnage treated forced the Inspiration yield up to 11,850,000 lbs. of copper last September. The two new units of the concentrator, now being installed, will increase the tonnage to around 18,000 daily. There should then be no difficulty in maintaining a monthly output of 12,000,000 lbs. of copper.

At a meeting of the board of directors of the Tamarack Mining Co. on Friday of last week President Eugene V. R. Thayer resigned and was succeeded by Charles S. Smith, president of the Old Dominion and Arizona Commercial mining companies. Mr. Thayer is understood to have taken the position only as a courtesy to the Calumet & Hecla interests at the time they retired from all representation on the board. Mr. Thayer still continues on the board of directors. Charles H. Altmiller has been elected secretary and treasurer. Incidentally, it is of interest to note that Mr. Altmiller, who started with the Bigelow copper interests 30 years ago, for many years worked on the books of the Tamarack Mining Co. before the management was turned over to the Calumet & Hecla people. The main offices of the Tamarack Co. have been removed to 50 Congress street.

Flotation Patents Decision is Won by
 Minerals Separation, Ltd.

On another page we give the official text of the decision handed down by the U. S. Supreme Court in the case of the Minerals Separation, Ltd., against Jas. M. Hyde. The suit is based on the installation of the flotation process at the Butte & Superior Co.'s mill at Butte, Mont., which the complainant claimed was an infringement of its patent rights.

With the U. S. Supreme Court's decision back of them, the Minerals Separation North American Corporation, the newly organized company formed to handle the business of the Minerals Separation, Ltd., in North America, and to control the patents of the parent company in this continent, it is expected that injunction proceedings will be started. These will be against various companies in the United States that are claimed to have been infringing its patents. Actual shut-downs, it is expected, will be the first step to be attempted, to be followed by a demand for an accounting for profits and damages in each individual case.

The contention of the Minerals Separation interests will probably be that all profits accruing, to each of the companies using flotation and not operating under its license, from the use of flotation itself will be regarded as its own. If the plaintiff does not regard the profits as sufficient, damages will be asked for.

It has been figured that out of an approximate production of 35,000,000 tons of ore produced in 1916 and in which production flotation was used, possibly 8,000,000 tons paid royalty, leaving more than 25,000,000 tons on which royalty is expected to be collected.

Of the companies working under a royalty basis are Anaconda, Inspiration, Greene-Cananea, and affiliated companies, paying the low rate of 4 cts. per ton royalty. It is not expected that other companies operating flotation processes can secure such a low rate at this time. Among these are Utah Copper, Chino, Ray Con., Miami and Butte & Superior.

The Minerals Separation patents in the United States now number 45, while applications are pending for 32 more. These patents cover every conceivable feature of flotation and the uses of ingredients.

The Effect of Peace Proposals on the
 Copper Market.

In the parlance of Wall street, war, at first, was a bear argument. Later it proved to be a strong bull card. Peace, for some time, has appeared to be a bear argument. What if it should prove to be a bullish development? There is no need to throw aside all semblance of acumen and adopt the narrow view point that a cycle of prosperity can stop instanter. The past gives us the knowledge that the change from depression to prosperity is gradual, and that likewise the transition from prosperity to depression is gradual, probably more gradual than the

upward movement because of the greater resistance that prosperity creates. From all signs, peace is not far off. The financial situation, notably the trend of foreign exchange, furnishes a barometer of proven reliability. Slightly more than 2 years of war has changed our prosperity from a foundation built on Europe's misfortune to one erected upon internal wealth. Therefore, the cessation of hostilities abroad should be welcomed and not feared. Europe will still be a good customer, especially for copper.

Developments of a nature that would violently unsettle the most strongly established market failed to exert more than a slight disturbance in the copper situation. The German peace proposals induced free offerings by speculative holders of copper, but with producers protected by a veritable bulwark of orders taking up 95 per cent. of their first half output, this momentous announcement, which may prove to be the initial step in bringing Europe's woes to an end, furnished adequate proof to substantiate the remark made several weeks ago in these columns, that the copper market was no longer dependent on the continuation of the war for the maintenance of its prosperous condition. Interests who were waiting for 40 cent copper were greatly excited by the prospect of peace, and began offering their holdings at concessions, and some consumers who failed to secure full coverage over the first half, were in the market, taking up this cheap metal.

Naturally, there cannot be very much of this copper for the market to absorb and, even if the German invitation results in a termination of hostilities, the copper producers have accumulated a back log that will serve to sustain the market until the period of readjustment from war to peace has passed. By the time that the shock has passed the producers will be ready to re-enter the market and name their prices. What business is now on their books is solid. There are no open or "bellows" contracts, nor are the obligations of the buyers such that they can cancel their orders if they become alarmed at the turn of events. It is fair to assume that Germany will make strong endeavors to promote peace, and with this state of affairs in mind it behooves the consumer of copper to maintain a level head. If they have contracted for their first half needs at high prices they are not enmeshed in a deal that will result in losses.

Every copper consumer can rest assured that his competitor will not obtain his raw supplies at lower prices, for the simple reason that producers have no more metal to sell, while the infinitesimal amounts that are available from second hands cut no figure.

What Will Further Development Bring Forth in the Jerome District?

The conviction prevails generally among mining men familiar with the geological conditions around Jerome, Ariz., that copper ore bodies of value are

distributed generally throughout a wide area in the Verde district, and that depth and development will disclose deposits of copper well beyond the confines of the "pay" belt as at present recognized, equal in value to those opened in the United Verde, United Verde Extension, Copper Chief, and other mines. This conviction is based upon geological conditions similar to those prevailing in the immediate vicinity of Jerome, where are located the United Verde and United Verde Extension mines; and the fact that commercial copper ore is being shipped regularly from the Copper Chief mine, located well to the south of the properties mentioned.

Out on the Verde north fault, beyond the Arkansas & Arizona and Jerome Victor Extension properties, the mineral conditions at surface are identical with those nearer Jerome, and hold forth promise of similar opportunities to mine at a profit. The same limestone and iron capping, iron-stained porphyry and monzonite which overlies the rich copper ores in the immediate vicinity of Jerome, and which were the guides to their location, can be traced for several miles beyond the A. & A. ground, across the properties of the Jerome-Superior, Jerome Daisy and Verde Copper Development companies.

To the south of Jerome similar mining conditions prevail at surface on the Michigan-Verde, United Verde Con., Boston & Jerome and other companies that are operating within the territory lying beyond the United Verde mine and this side of the Copper Chief mine. By reason of these unusual surface showings the belief is spreading that the United Verde copper belt is very extensive.

In a recent editorial item on "Over-estimating the Value of Mine Machinery," reference was made to the old D-21 stoper drill, with a question as to whether our correspondent's remarks applied to what seems to be now designated as the DA21. On the latter point, another correspondent takes exception to the reference, saying that the present DA-21 drill has been for a number of years one of the standard stopping drills used extensively in all parts of the country. Companies in the Colorado field using it include the Portland and the Tomboy. Probably our original informant's remarks applied particularly to the D-21. We shall be glad to hear further from any of our readers having experiences with these or other stopers, or comparative data which will be valuable to operators.

As a result of the depletion of so-called floating stocks and the continued demand for minting purposes the strength of the silver market will now be maintained. The present price of bar silver 75½ cts. compares with 67⅜ cts. Oct. 30, and is only 3 cts. away from the high of many decades, attained last May. The decline at that time was attributed to profit-taking by speculators, and control of the silver buying for minting purposes by the allies. The most important factor, however, was the actual and speculative selling in the Indian bazaars and from China.

PERSONAL.

J. Ralph Scott of Hardington, Ont., is visiting at Calumet, Mich.

Joseph MacDonald of Guanajuato, Mexico, is in Los Angeles, Calif.

G. A. Gibbon, mining engineer, has returned to the United States from Péru.

H. W. Fesing of Houghton, Mich., has gone to Los Angeles, Calif., on professional business.

T. W. Mather, Guayaquil, Ecuador, has left that city permanently and is now in Pacific Grove, Calif.

D. Thomas has accepted the position of general manager of the Davidson mines at South Porcupine, Ont.

J. F. Cowan, general manager of the Tucson-Arizona Copper Co., Tucson, Ariz., is in Salt Lake City, Utah.

D. MacGavin of the Canadian Mining Corporation, Toronto, Ont., is spending the holidays in San Francisco, Calif.

H. D. Richardson, superintendent of the Boise-Rochester Co., Atlanta, Idaho, has resigned and left for Los Angeles, Calif.

M. C. H. Little, mining engineer, is leaving Canada to become an officer of the English tunnelling engineering force in France.

E. Gybbon Spilsbury, consulting mining and metallurgical engineer, New York, has returned from a professional trip to Cuba.

C. F. Sturtevant, Salt Lake City, Utah, has left for Jerome, Ariz., where he will take charge of the Jerome-Pacific mines.

James MacNaughton, general manager of the Calumet & Hecla Co., Houghton, Mich., has recently made Boston, Mass., his headquarters.

C. Chynoweth, mining engineer, New York, and secretary of the Wolverine & Arizona Co., Bisbee, Ariz., has been inspecting the company's property.

Newton W. Emmens, mining engineer, Vancouver, B. C., is in the Coeur d'Alene district, Idaho, in the interest of the Kula smelter, British Columbia.

C. L. Parsons, U. S. Bureau of Mines, is returning to this country from Europe where he has been studying methods of manufacturing nitrogen.

Frank M. Leland, consulting engineer for the Empire Copper Co., Mackay, Idaho, has resigned and F. L. Vahrenkamp has been appointed to fill the vacancy.

Henry F. Collins has been made consulting engineer of the Huelva Copper & Sulphur Mines, Ltd., Cueva de la Mora, Valdelamusa, Spain. He was formerly general manager of the company.

H. J. Wallace, field engineer for the Anaconda Copper Co., at Great Falls, Mont., has been made superintendent of construction, which position was made vacant by the recent resignation of F. J. Brule.

H. M. Wolflin has been designated by the U. S. Bureau of Mines to succeed Edwin Higgins, in charge of the California co-operative work of the Bureau and the Industrial Accident Commission. Mr. Wolflin had charge of this work from January, 1914, to January, 1916, during which time he made a preliminary survey of mine-safety conditions in the state and assisted in drafting the mine safety rules. When Mr. Higgins' resignation as chief mine inspector became effective, Mr. Wolflin made a request of the Bureau of Mines that he

again be assigned to take charge of the work. The Industrial Accident Commission has appointed Mr. Wolflin chief mine inspector.

A. D. Cox has resigned as superintendent of the Union Hill mine, Grass Valley, Calif., to enter the employ of G. S. Johnson & Co. The vacancy will be filled by E. MacBoyle, formerly general manager of the company operating the mine.

C. E. Van Barneveld, formerly at the head of the Mines Department at the Panama-Pacific International Exposition, San Francisco, has accepted a position as supervising engineer and metallurgist for the U. S. Bureau of Mines, at Tucson, Ariz.

OBITUARY.

Joseph Carson, superintendent of the Gold Hunter Mining & Milling Co., Mullan, Idaho, died at that place on Dec. 10.

Jesse W. Davis, a pioneer prospector of the southwest, passed away in Silver City, N. M., on Dec. 6 from pneumonia. In the early prospecting days he was closely associated with James S. Douglas in the country around Prescott, Ariz.

Oscar C. Steele, at one time operator of the Burning Moscow, Andes, West Con., Virginia and other mines on the Comstock, passed away on Dec. 10 at Virginia City, Nev. He was born in Ohio in 1838 and migrated to this country in 1859 and later became interested in various mining enterprises of this district.

SCHOOLS AND SOCIETIES.

American Institute of Mining Engineers.—The Utah section of the Institute held a postponed meeting at the Hotel Utah, Salt Lake City, Utah, on Dec. 16. Officers were elected, after which an interesting paper was read by J. M. Colwe, "Notes on Flotation in 1916," and a second by Erwin Wilke, "Manufacture and Use of Sulphuric Acid."

American Institute of Mining Engineers.—The Chicago section met on Dec. 22 at the Chicago Engineers' Club. After dinner, Alonzo G. Kinyon of the Powdered Coal Engineering & Equipment Co. read a paper on "Burning Powdered Coal" in which the application of this class of fuel in the reverberatories at Anaconda was discussed. H. B. Pulsifer, Armour Institute, addressed the meeting on the "Metallurgical Plants About Chicago: The Greatest Metallurgical Center on Earth."

University of Utah.—For miners and prospectors a course of 4 weeks in length, beginning Jan. 8, will be given. It will comprise 36 lectures and 20 laboratory periods. Prof. F. J. Pack and Prof. Schneider will have charge of the geology and mineralogy; Prof. Lewis of mining and milling, and Prof. Bradford of metallurgy. A nominal registry fee of \$1 only is required. In addition Prof. Bradford will conduct a course in industrial science. Lectures will be given on the mining, milling and smelting methods in general as practiced around Utah and neighboring states.

University of Illinois.—The senior mining engineering students, under the direction of Professors H. H. Stoek and E. A. Holbrook, have completed their annual inspection trip. This year the trip included an inspection of the State Mine Rescue Station at Springfield, Ill., the lead smelter at Collinsville, Ill., and the Laclede byproduct coking plant at St. Louis, Mo. From here the party established headquarters in Flat River, Mo., and spent several days visiting the lead mines and mills in the district. A side trip was made to the old Mine La Motte, which is being rejuvenated by modern methods. Afterwards several of the large coal mines in southern Illinois were inspected.

shipped by the Orenstein-Arthur Koppel Co. of Koppel, Pa., to Marengo & Parodi at Quito, Ecuador.

To resist corrosive action the bodies of these cars are built of oak heavily reinforced by galvanized bars. In other

DUMP CARS FOR ECUADOR.

respects the cars are of the maker's standard cradle type with round buffer frames, spring bumpers, continuous draw bars and roller bearings. The cars are constructed to dump clear of the rails and under-frame, thus facilitating the work and avoiding any delay.

TRADE PUBLICATIONS.

Mine Cars and Wheels for Mine Cars. Hockensmith Wheel & Mine Car Co., Penn Station, Pa. Booklet; pp. 32; illustrated.

Several of the company's various types of wheels, their construction and advantages are described. Mine cars of both wood and steel construction are illustrated and briefly described with some of the accessories used in underground haulage.

Motor Trucks. General Motors Truck Co., Pontiac, Mich. Booklets; illustrated.

Each of the three booklets treats on different types of trucks. In one a 1500-lb. truck is described; another 1½ to 2-ton trucks are described which use chain drive; in the third trucks for handling loads of from 3½ to 5 tons are dealt with. In each of the three the truck under consideration is described as regards its construction and half-tones showing the truck in use are included.

Gas Engines. The Bruce-Macbeth Engine Co., Cleveland, Ohio. Booklet; pp. 20; illustrated.

Is confined to information and talks regarding the company's experience with its engine in operation rather than its construction. Besides bringing out the advantages of this engine in operation at various plants considerable of the contents is comparative with respect to steam as a prime mover and special mention is given as regards costs. Engineering data of value is given in the concluding pages of the booklet.

Duplex Compressors. Steam, Belt and Motor Driven. Chicago Pneumatic Tool Co., Chicago. Bulletin 34-M; pp. 35; illustrated.

A general description of class "O" compressors is given as well as detailed descriptions of the separate parts making up this class of compressor. Eight different types are made in this class and among the more noted things in their construction is the use of Simplate flat disc valves. The several types includes types for driving by steam, motors or belts and have varying capacities of 511 cu. ins. per minute to 4424.

INDUSTRIAL AND TRADE NOTES.

The Magnesite Refractories Co., Portersville, Calif., recently incorporated with a capitalization of \$200,000, proposes to build one of the largest magnesite manufacturing plants in the country, reducing crude magnesite for shipment to the east, and manufacturing refractory brick and plastic materials.

The Utah Karns Tunneling Machine Co., of Salt Lake, has taken a contract in one of the Utah districts to extend a 4080-ft. tunnel 500 ft. further. Over 400 ft. has previously been driven very successfully, breaking 15 ft. in one shift with about 100 lbs. of powder. In this 7 by 7-ft. tunnel it is using its heading machine, which cuts a 13-in. hole. This is drilled in 15 ft., and while that is being done, two small air drills are being operated to drill the holes that are broken to the heading machine hole.

President McGregor, of the Union Iron Works, the Pacific coast shipbuilding subsidiary of Bethlehem Steel Corporation, says his company now has contracts that will mean employment of 11,000 men for 2 years. At the Alameda plant 2000 additional men are being put to work, and at San Francisco 750. Contracts already closed, or practically closed, aggregate around \$65,000,000. In addition the company is a bidder on submarines and cruisers for the United States navy, and it is hoped that part of the naval construction contracts will be placed with it.

NEW PUBLICATIONS.

Manufacture and Uses of Alloy Steels. By Henry D. Hibbard. Washington, D. C., U. S. Bureau of Mines. Bulletin 100; pp 77.

The various kinds of alloy steels are considered separately. Each is taken up in a similar manner, the method of making the same being first given and followed by an account of the peculiarities and properties of the alloy and uses to which it is most adaptable.

Gold, Silver, Copper and Lead in South Dakota and Wyoming. By Charles W. Henderson. Washington, D. C., U. S. Geological Survey. Mineral Resources of U. S. 1:13; pp 14.

Both states are treated separately in general and by counties. In reviewing the state as a whole production and market conditions are the principal features, while in the review of counties the operation and production of the various properties and companies are considered.

Chemical Study of Illinois Coals. By S. W. Parr. Urbana, Ills., State Geological Survey. Bulletin 3; pp 86; illustrated.

Although sufficient description of methods employed is given these descriptions are more in the form of discussion on the suitability of the various methods and further discussion of the results of analyses on various coals in the state. Among methods reviewed are those used in field sampling and determining ash and moisture contents.

The Flotation Process. By Herbert A. McGraw. McGraw-Hill Book Co., New York. Book: pp 249; illustrated. For sale by Mining World Co., \$2.50.

The first few pages take up a description of the more important flotation machines which have been and are now being used, with information on patent literature. The nature and uses of oils is dealt with in a separate chapter followed by a chapter on various flotation systems and machines of more recent date. Methods for testing ores to be subjected to flotation are brought out with the necessary details and the remaining, about one-half of the book, describes operations and plants of several companies using the process.

Late News From the World's Mining Camps

Editorial and Special Correspondence.

ALASKA.

Atlin.

At the Engineer mine operations and production have been steady throughout the summer. Supt. Alexander has had 26 men busy most of the time, and now is increasing the number of machine men underground. Operations will continue throughout the winter.

Telegraph creek is also coming up again and many proprietors have been looking over the ground and developments being carried on in several localities are showing up good. It is further rumored that some capitalists from Wrangell are on their way in to look over some of the ground.

Seward.

"Free use permits" to mine in the Matanuska and Bering River fields in the parts of those fields which have not been set aside for leasing purposes are now obtainable. The Commissioner of the Land Office has informed the Land Department of the Engineering Commission to this effect.

Skeen and Charles Emsweiler are operating at Porcupine bay. Specimens were not taken from the ledge itself but were found immediately beneath the ledge on shelves. They carry over 30% copper and the ore is the same class as the ore at Latouche, which, however, carries only about 16%. The ledge is located behind a glacier and can be seen up above but is in a position where it cannot be reached conveniently. The discoverers figure it is about 20 ft. wide and they can trace it distinctly for 100 ft. or so from below. The prospectors took ladders but even with this aid they were unable to reach the spot exactly although they found plenty of pieces of float below on shelves of the steep incline.

Sulzer.

At the Florence mine of the Alaska Tidewater Copper Co. on Prince of Wales island, a body of grey copper has been opened which contains some gold. The ore is said to run \$23.60 in gold, \$1.30 in silver and 5.5% copper, or a total value of about \$52. The company is now preparing to fully equip the property. The ore occurs in a schist with blebs of calcite and quartz. The new find is on the coast about 10 miles from here, and it is the company's intention for the future to construct a wharf, for shipping, at the mine. The company is being financed by H. E. Wills Co., Seattle. W. E. Hall, Seattle, is president; C. P. Catron, Seattle, is vice-president, and with R. C. Hill, Seattle, are the executive officers. The company is a \$1,000,000 corporation.

The Alaska Industrial Co. is operating the Jumbo mine under the management of Senator Charles E. Sulzer. Shipments are being made at regular monthly intervals and new development work has been accomplished this fall, disclosing several new ore bodies of copper, which are said to average 7%. These ore bodies are contact deposits of chalcopyrite.

Seward.

The Tolovana district which was only in a prospect stage during 1915 produced \$60,000 in gold during that year. In 1916, however, the district has proven to be a real producer and has shipped gold valued at about \$600,000, the production having been mostly made from Livengood creek.

Ketchikan.

The Seaboard Copper Co., Seattle, Wash., has recently been formed to operate properties at View Cove on Prince of Wales island and it is said some of its showings run 20% copper.

San Francisco and Portland capitalists have recently formed the South Eastern Alaska Copper Co., a \$3,000,000

concern which has taken over the Big Harbor mine on the west coast of the island. This company's holdings constitute a group of 16 mining claims, part of which are now undergoing development. The property is equipped with a 2400-ft. aerial tram which connects the main workings with the company's wharf. On the Northland No. 1 an adit has been driven 120 ft. to the hanging wall of the lode. An inclined shaft connects the drifts from the adit to surface, while the vein has been crosscut in several places. Last summer several small shipments of chalcopyrite were made to the Tacoma smelter which netted better than 7% and carried some silver and gold. The company expects to be in a position to resume regular shipments to Tacoma within 90 days. To increase the present tonnage from this mine the shaft on the Northland No. 2 is being continued to the 400 level, as this shaft is being sunk on ore. Returns from assays made on the 200 show a good grade of shipping ore.

ARIZONA.

Miami.

The Globe Bullion Co., a recently organized corporation, has opened offices here and are operating south of the city. A road has been completed to the mines, where 14 men are now working, and sinking has been started. At present 3 faces are in good ore, it is said.

At the mines of the Inspiration Con. Co. considerable is being done with respect to the efficiency of tramping. A sufficient number of sidetracks and a signalling system have been installed. It is expected that delivery will shortly be made on two compressed air locomotives at present being built by H. K. Porter Co., Pittsburgh, Pa. These will bring the total number of air locomotives in the mine to 11. There will always be nine in operation, one being held in reserve and one under repair.

The water supply tank has been moved from its former location south of the Scorpion shaft to the hill north of the main shaft. Work has been commenced on the piping connecting this tank with the mine pumps which are on the 6th level. At the inclined shaft stations, on the 3rd, 4th and 6th levels preparations are under way for the installation of steel drawbridges to replace the wooden structures. These bridges are used for the transfer of supplies from the tunnel on 3rd level to the 4th and 6th levels. Without the bridges it would be necessary to transfer the supplies from the third level cars to the skips, and then to the cars on the level. By the use of the drawbridge the original car into which the supplies are loaded can be hitched to the rear end of the skip and lowered directly to the required level, landed, and run into the working place without handling more than to load and unload. The Door thickener tank, 200 ft. in diameter, will be completed in two months and construction on the laboratory at the mill is being rushed. The latter structure is a 2-story building of concrete.

Globe.

The Old Dominion Extension, adjoining and dovetailed into the Old Dominion, is attracting considerable attention because of the fact that its formation and surface ore occurrence is identical with the adjoining older property. Several thousand dollars' worth of ore is exposed in its workings, which consist of two 100-ft. shafts, about 500 ft. of drifts and tunnels and several winzes. The company's management plans to sink its main shaft at a point 300 yds. from the main tracks of the Arizona Eastern railroad, contiguous to the See Bird shaft where the latter enters the

apex of an oxide vein along which a drift has been driven for 200 ft., and from which picked samples running as high 25.15% copper and 13.84 ozs. silver have been taken. Every hundred feet in depth a prospect drift will be driven into this vein until sufficient depth in the shaft has been reached to drive a drift along the vein to the point of its intersection with the great Pinal fault, wherein and contiguous thereto the Old Dominion vein encounters such rich smelting ore. A force of 25 men has been employed building a road to the Iron Mask workings of the Old Dominion Extension higher on the mountain with the object of hauling diamond drill equipment to that portion of the property to determine the dip of the heavily mineralized fault between the quartzite and lime, whose surface has been slightly developed by shallow workings to the extent of showing about \$20,000 worth of argentiferous copper ore. No shipments of surface ores will be attempted, the management's intention being to develop the property upon a conservative scale for the ore bodies they believe it contains.

Oatman.

Among the numerous prospective mines of Oatman which are being developed interest just now centers on the Crescent, Nellie and Adams in the Black Range section, and the Ivanhoe, which lies between the Times mine and the Crown City property of the Tom Reed Gold Mines Co., all of which have reached interesting points in their underground workings.

The Nellie mine has entered the vein in the shaft at 375 ft. and purposes to continue sinking, passing through the vein and to the 500 level where a crosscut will be driven to cut the vein again. On the 300 level considerable drifting was done and some good ore encountered, but it was not uniform. It is the belief that a depth of 500 ft. will disclose a body of good ore. It is the plan of development to drive a shaft to the east, where three veins appear to form a junction.

At the Crescent the tunnel has cut the vein exposing a ft. of fine looking quartz characteristic of the Black Range section. Crosscutting will be continued to the hanging wall and a drift then will be driven southeast toward a known ore shoot.

The Adams shaft was sunk to a depth of 425 ft. and a station cut at 400 from whence a crosscut is to be driven to the vein, which should be cut within 50 ft. The company is now installing an 80-hp. engine and large pumps and making provision to handle a heavy flow of water, which is expected. The Adams has a fine surface showing and the acquisition of the property was recommended by C. H. Palmer, Jr., upon whose report Frank Keith, Seeley W. Mudd and their associates undertook the development of the United Eastern mine. E. H. Newlands of Los Angeles is president of the Adams Mining Co. and H. A. D'Arcy, known among Nevada mining men, is manager. These two and Mr. Palmer form the board of directors.

Considerable interest was aroused this week by the visit of Horace V. Winchell, the noted mining engineer, who spent the week in examination of the Big Jim and Ivanhoe mines. These properties are under the same management. The Ivanhoe recently cut a promising vein on the 500 level after passing through a fault and is now drifting on the hanging wall of the big dike.

At the Big Jim preparations are being made to resume sinking from the 500 level and by the time the proposed 400-ton mill is under construction two or more levels will have been opened below the 500. Supt. Keating places the tonnage already developed on and above the 500 level at 250,000 tons of an average value of \$12 to \$15. He estimates mine and mill costs at under \$5 per ton. It will take 2 or 3 months to complete mill plans and actual construction of the big mill will not commence until next spring.

Development work will continue on the easterly end of the Tom Reed properties, and an immense body of good ore has been opened through the Aztec shaft at a depth of 500 ft. What relation the vein bears to the Big Jim has not been established but in dimensions and structure it bears a strong resemblance, both veins having an average width of 30 ft. The Aztec ore shoot is said to average \$20 to \$50 for a considerable distance in one of the drifts. E. M. Rabb, superintendent of the Tom Reed mine, is busy placing orders

for a new unit to the mill, which will increase the capacity from 175 to 350 tons per day. He expects to have this unit finished and in operation by July 1, next, in spite of the difficulty in getting machinery.

While the exact date on which the United Eastern mill is to start has not been definitely decided, it will be some time before the 1st. Practically all the construction work has been completed and everything is about in readiness to start the machinery. The No. 2 shaft of three compartments has been fitted with ore pockets on the 4th, 5th and 6th levels, an electric flash-light signal system installed and electric lights strung along the crosscuts which connect with the vein. This underground work having been finished and everything put in readiness for stoping ore, shaft sinking has been resumed in No. 2 shaft, which is down 60 ft. below the 665 level. According to the dip of the vein on the levels above the shaft should cut the hanging wall at about 950 ft. Developed ore between the 300 and 665 levels is estimated at 200,000 tons, valued at \$5,000,000, all of which has been opened up since March, 1915. The vein is 25 to 50 ft. in width, and with the exception of an occasional "horse" of country rock, is solid ore throughout. Some very rich ore has been encountered in the drifts and crosscuts, and the vein on the 400 level averaged \$22.93 across 25 ft. The mill will have a capacity of 200 tons per day and is expected to make an extraction of 97% at a cost of less than \$2 per ton.

Active preparations are being made for the construction of a mill at the Gold Ore mine near the Gold Road. For 3 months the Gold Ore milled its ore at the Gold Road mill. It is said that the average returns of the company were \$30 per ton. The money received from this source will be added to by subscription from several wealthy eastern stockholders and the mill will be built early in 1917.

The success of the Big Jim, United Eastern, Tom Reed, Gold Ore and other companies, has brought about renewed activity throughout the Oatman district, and there are now between 40 and 50 properties operating besides those doing annual assessment work.

Paradise.

The strike made recently at the Hill Top mines has been confirmed. It is said that several prominent mining engineers representing large eastern capital have examined the mine within the past few weeks and that their reports are without exception most favorable. During the past two years the company has driven a tunnel from the westerly side of the Chiricahua mountains through to the easterly side, and built a road from the portal of the tunnel to Paradise, for the purpose of hauling out ore. R. O. Fife, the Hill Top superintendent, is now busy installing a new 500-hp. plant and the necessary buildings to house it along with other buildings, and getting things shaped up to handle a large production. The board of directors consist of John Hands, who with his brother Frank formerly owned the property, and a Mr. Kastrup, a well known banking man of Chicago.

Jerome.

Another property for which extensive development work is being planned is that owned by the Verde Central Mines, Inc., which will be placed in effect Jan. 1. The property—formerly the Verde King—comprises 308 acres of patented mineral ground located in the immediate vicinity of the productive area of the district. It adjoins and is almost surrounded by holdings of the United Verde Copper Co. and of the Hull Copper and Cleopatra Copper companies, which recently passed to the control of the W. A. Clark interests. Adjoining on the west are holdings of the United Verde Extension Co. and the Boston & Jerome Copper Co., while to the east the claims of the Verde Apex Co. sideline.

Chloride.

The Silver Hill offers to finance half a dozen sets of leasers on its property until its new mill is in operation.

Ruby silver ore showing in quantities in both Midnight and Keystone mines.

The question of title to town property is causing considerable agitation in Chloride. The camp is filling with people who refuse to be bound by the watchful waiting

policy of old residents and an attempt is to be made to have the government act.

Several men have been put to work on the property of the Rainbow Mining Co.

Four feet of the best ore ever found on the property was cut by shaft at the Georgia at a depth of 135 ft.

New shaft has been started on Rattlesnake group to cut ore at a greater depth.

The Home, Pastime and the Golden Star groups were taken over last week by the Holmes interests of Salt Lake.

F. M. Manson, head of the Western Ore Purchasing Co., of Reno, Nev., has men at work sampling the principal properties of the district. It is fairly certain that his company will establish a sampling works here.

The Georgia has encountered more water, and the company planning to install heavier hoist machinery and pumps; country rock is highly mineralized, principally copper-stains.

Silver Hill just sent out carload of ore to Selby and expects to ship another soon.

The Keystone Con. Mining Co.'s property is located in the Cerbat range. The Tennessee mine lies nearby. The Golconda mine, also a well-known property on the southeast, is now mining its ores on the 1200-ft. level. There are many other mining properties in the vicinity under operation with large developed ore bodies down to the 500-ft. level. In this particular district some 30 years ago nearly all of these properties were trenched on the surface and produced native silver. When approximately 100 ft. depth was reached the ores turned into sulphides, which were worthless in those days and the work ceased.

The Keystone property was particularly rich and productive, shipping many thousands of dollars in native silver. It was taken with ox teams to the river, where it was placed on barges and towed to the ocean and shipped by a sailing boat to Wales. When the sulphide ores were reached the work ceased and no work has been done until the present corporation took over this property about a year ago. At a depth of 150 ft. there are great bodies of copper sulphides. At 200, 250 and 300 ft. depth the ores are again producing very rich silver, which can easily be detected with the eye, mixed, combined with gold and copper. This vein has been drifted on for 700 ft. in length and still in ore. The property is being equipped with a flotation plant of 150 tons capacity, which will be completed and in operation within 30 days. Electric power, railroad and every other favorable facility is afforded.

Kelvin.

Pinal Development Co. has attained a depth of 500 ft. by driving a 1500-ft. tunnel. An order has been given for a gasoline hoist and air compressor, and the proposed new shaft, 1000 ft. down the mountain side below the tunnel entrance, is being started. This work is close to Erman station. J. C. Devine, president and manager, has his office in Phoenix. C. T. Carpenter, secretary, is in Los Angeles, in connection with financing the project.

CALIFORNIA.

Goldstone.

The United Goldstone group is developing well. On the Gold Ring Extension claim a 3-ft. ledge of good ore has been opened by H. Smith, and shipments have begun to the custom mill. The Blue Bird claim has been taken under lease by Los Angeles capitalists and operations commenced. Considerable work is also being carried forward on the Gold Ring and other claims by the company.

Bars of gold bullion have been shipped recently by the Goldstone, Redhrige, and United Goldstone companies. The custom mill is running at full capacity and it is reported it may be increased in the near future. At present most of the ore milled is coming from the three leading companies.

Richard Mansfield has acquired the McDonald claim, adjoining the townsite, and is arranging for operations. A. A. Turner has taken an option on the Copper Queen and

will form a company for operation of the mine. Work is going on at the Three C. group, and the owners of the Honey Bee have arranged for developments. Several other properties are active, and large numbers of leasers are coming into the district.

A hoist and compressor are being installed on the Goldstone group, and Manager Greenwalt plans to commence extensive shaft work in the immediate future. Gerome Craite, leasing a block of Goldstone ground, is installing a gasoline hoist preparatory to sinking on the vein recently intersected.

Porterville.

The Magnesite Refractories Co. has been formed with a paid-up capital of \$200,000 to operate in this field. The holdings consist of 73 acres in the Zante hills, 4 miles north of town. It is claimed that 110,000 tons of high-grade ore have been developed. The company has arranged for the construction of a calcining plant with a daily capacity of 125 tons. Harry L. Doyle is manager.

Grass Valley.

At a depth of 1100 ft. a shoot of rich ore has been encountered in the Sultana mine. It is stated to range from \$50 to \$300 per ton and appears to be developing into a large vein. Albert Crase is superintendent.

Unwatering of the Allison Ranch mine has been completed and Manager C. K. Brockington expects to have the property in shape for production before the end of December. Hoisting and pumping equipment have been installed and construction of the mill building is making good progress.

Oroville.

A 4-ft. ledge of \$30 ore has been intersected on the 400 level of the Banner mine. It is widening steadily and is showing considerable free gold as work advances. The management has arranged to place 10 stamps in operation, and construction of the 4-mile power line rushed; 25 men are employed and this force is to be increased. In addition to the rich quartz on the 400 level, large quantities of profitable ore have been opened at other points in the lower workings. The Banner is one of the oldest quartz mines in this district and has produced much rich ore. Richard Phillips is managing owner.

The Butterfly gravel mine has been taken under bond and lease by the Morris Ravine Leasing Co., composed of W. T. Baldwin, Charles Belding, Charles Bills, R. S. Kitrick, Edward James, Harry Mengler, Fred Tegrunde, Gordon Nesbitt, Dan James and H. H. Tegrunde. A station has been established in the main tunnel and a hoist installed to facilitate extensive prospecting of a series of highly promising gravel channels.

W. T. Baldwin is installing a 3-stamp mill on the Mascot mine, located above the Banner group. A large tonnage of \$15 ore has been blocked out and arrangements made for much new work underground. At the Hedges property Baldwin has erected a 5-stamp mill and plans to commence milling \$15 ore within 10 days.

Georgetown.

The Woodside mine has been taken under bond from the Woodside-Eureka Mining Co. by a concern represented locally by R. H. Shannon. Operations will be under the management of A. E. Westover. Unwatering and development of the property will commence at once. The Woodside has produced much good ore but has been idle several years.

Placerville.

The Lemon quartz mine has been acquired by the Holly Quartz Mining Co., and developments will be prosecuted under the management of C. E. Stovall. The mine has produced considerable rich ore and with deeper work is expected to yield a heavy tonnage of profitable quartz.

Copper City.

Driving of the main tunnel will be resumed immediately at the Shasta-Belmont copper property. Within a short distance the management expects to strike the main ore body, when shipments will be made to the Thompson smelter. Considerable shipping ore is blocked out in the upper workings. The ore also contains considerable zinc, gold and cop-

per, and it is probable the zinc product will be sent to the electrolytic zinc plant the Mammoth Copper Co. is erecting near Kennett. Orders have been placed for an engine and blower. Operations will be in charge of William Arps. W. E. Casson, Carson City, Nev., is manager.

Sutter Creek.

At a point 650 ft. west of the 1800-ft. station of the Central Eureka mine a large vein of low-grade ore has been encountered. North and south drifts are being run on the vein in hopes of intersecting pay ore. Sinking of the shaft to the 3400-ft. point is proceeding, and from both levels drifts will be thrown out to seek the main vein.

Huge concrete piers for the headframe have been completed at the shaft of the Old Eureka mine, and construction of the hoisting works will begin shortly. The steel-and-timber headframe will rise to a height of 92 ft. above the concrete foundations. The shaft collar will be brought to a level with the timber shed and compressor room by the filling in of the low ground between the shaft and wagon road, greatly simplifying transportation. Unwatering and retimbering of the shaft has progressed to the 1000-ft. point. The workings below the 800 level were found in splendid condition, and the management is confident of its ability to commence active mining before the end of January.

Caliente.

Five tons of high-grade antimony ore is going out daily from the Big Fifty mine, located about 15 miles from Caliente. A considerable tonnage of shipping product is stated to be exposed. A mill may be erected to treat the lower-class ore.

Glenville.

Rand Minerals Co., San Francisco, has developed a tungsten mine at Glenville, 47 miles northeast of Bakersfield, and has constructed a concentrating mill of 100-ton capacity, which is to be in operation before Jan. 1. Main features of the mill are crusher, rolls and Wilfley tables, all machinery being driven by gasoline engines. The ore consists of Scheelite and pyrrhotite in a siliceous gangue, accompanied by some garnet. Much of the scheelite is crystallized. The mine is developed through tunnels and shafts. It is expected the mill product will run 60% WO₃. F. R. Heinick and associates control the company.

COLORADO.

Rico.

Snyder & Wiggins have leased the upper workings of Rico Argentine, while the lower tunnel is being driven, with recently installed power drills, by the company. A shipment is now ready and it is said that the ore runs 11% copper and 12 ozs. silver. The ore is coming out of one of the old stopes that has not been worked for many years. The deeper workings here are under water. With a view to unwatering these workings and to tap some of the known ore shoots at greater depth, the company is running the new lower tunnel. A short time ago the face struck a bed of heavy iron sulphides under metamorphosed limestone. This lime is generally found associated with the ore. The new drifts out from the main tunnel are reported showing some ore. At a point 300 ft. from the portal a body of ore was penetrated that sampled from 4.7 to 5.25 ozs. silver, 7.1 to 9.8% lead, 9.92 to 18.38% zinc and .87 to 4.55% copper.

Breckenridge.

The overhauling of the mill of the Pioneer Con. Mines Co., and addition of equipment has been completed and ore is being stoped from the Extension vein in the Deadwood tunnel. This tunnel is being driven to crosscut veins under the Jumbo workings. Contractors are making headway in driving the new main tunnel, the portal of which is at the lowest point on the company's property. This tunnel will be the means of cutting the network of Gibson Hill veins at a depth much lower than has been the case in former development. The tunnel will not only enable the cutting of the Extension vein at depth, but will make it

possible to get under the Jumbo deposits and eventually the Little Corporal can be made more accessible, though it is likely that special development plans concerning the latter property will be made.

Machinery is being shipped to the placer ground of the Lec Mining Co. It will arrange to commence as soon as equipment can be placed on the ground the sinking of a shaft. Previous prospecting found not only good gold values but lead and silver nuggets. Men have been testing the ground with a drill, with a view to dredging it, but huge boulders have impeded success.

The new Wellington shaft is being projected to open the Oro vein at a deeper point and is proceeding in a satisfactory manner. Preparations are also under way for the resumption of sinking in the main shaft which will go down from the 5th level.

Aspen.

At the Smuggler mine where fires have smouldered in the deepest part, preventing operation, a flood of water has developed which is expected effectually to end the burning. The 18th level was flooded so quickly that the water had risen to the necks of some of the miners before they could reach the cage to be hoisted. Arrangements have been made for installing extra pumps to assist the electricians in lowering the water when the desired time comes. Draining of the newly flooded area will not be undertaken, it is planned, until the fires are completely quenched.

Idaho Springs.

At the Gem mine the Newton mill is going to install a flotation plant in addition to its present concentration. The change will be made about the first of the year.

Under Captain Ripley, the French Flag is being systematically developed. In a drift which is being driven west, 160 ft. from the shaft, on the 315 level, a 2½-ft. vein was broken into which returned a value of \$55, principally copper and gold. Ripley says they have about 100 ft. of this ore blocked.

Work is progressing on the 2000 level of the Seaton mine under H. E. Machol. In a raise, 18 ft. from the tunnel level of the Newhouse, a streak of high-grade lead has been opened. The raise was started on a small streak that has been getting better. A shipment was made of about 8 tons that returned better than \$90.

Denver.

The Mammoth-Virgin Mining Co. has been incorporated with \$50,000 capitalization and 50,000 shares, and the Broderick Mining & Milling Co., with \$100,000 capitalization and 100,000 shares. Both companies have a term of existence of 20 years and have their main offices in this city.

Greenville.

The Lulu group, about 2 miles from Clark postoffice, Routt county, has recently been equipped with machinery by J. E. Davidson, who is financing the development and actively engaged in the management. Davidson won favorable comment over his achievement in building the Midland Terminal railway, as contractor. This railway has served the Cripple Creek district for many years. The Lulu group is owned by George and Will Franz, both of whom interested Davidson in the property, which, it is stated, has a good vein showing, from which it is expected to eventually ship a commercial ore carrying copper, lead and silver.

GEORGIA.

Dahlonega.

After receiving the November report of A. H. Head, metallurgical engineer of the Crown Mountain Co., W. D. McGinnis, general manager, began work immediately installing a 5-ton agitating cyanide plant to handle the sulphide ore of the Wallace vein which assays from \$20 to \$100. Only a small percentage of the gold can be saved by amalgamation. The tests show that from 85 to 92% of the values can be recovered with cyanide in 3 hours' agitation. The plant will also be used to handle concentrates from the sand vein, and a larger plant installed as soon as the small

plant has been proven a success. G. C. Thornton, mechanical engineer, has charge of the installation.

John F. Sargent is pushing the work of building the dam across the Chestatee river at the Pyrite mine to furnish power to work the property on an extensive scale. A survey has also been made and the railroad from Brookton will be extended to the mine. This will bring the railroad within 6 miles of Dahlonega. Engineers who have drilled and examined the property estimate that there is over 14,000,000 tons of ore in sight with an average value of over \$15, including the sulphur, copper, gold and iron contents.

At the Toledo mine operated by Tonson and Cowan good ore is showing in four places. High grade has been milled from the Smith shaft, which, owing to the sulphide, only yields a small percentage by amalgamation. The tailings have been treated by Cowan in connection with other laboratory tests and results obtained by a combined progress of cyanide and concentration.

IDAHO.

Wallace.

The O. W. R. & N. Co. has awarded the contract for construction of its new Beaver creek branch in the Coeur d'Alenes to Twohy Bros., railway construction contractors of Spokane and Portland, Ore., according to announcement made by Robert Twohy, and work will begin as soon as crews can be recruited and machinery assembled. The contract price is said to be approximately \$200,000, and it is probable that the 10-mile line will be completed and ready to operate in the next six months. The new line will connect with the Murray branch of the O. W. R. & N. at Idora spur, and will provide transportation facilities for the Consolidated Interstate-Callahan, the Ray-Jefferson, Idora, Tuscumbia, Virginia, Sunset, Toughnut, Friend and several other properties in the region.

Osborne.

A 30-day run of the Silverado Mining Co.'s new 100-ton mill has demonstrated that the plant is effecting a good saving, according to C. D. Muxen, secretary. "The mill was designed and construction supervised by W. L. Ziegler, who devised the treatment system especially for our ores," said Muxen. "The plant has been treating only the output of the Nellie mine, and has been running but 8 hours a day, treating about 30 tons each period. Assays of the tailings show from a trace to four-tenths of an ounce of silver. We expect to begin receiving ore from our own property in a few days, when the plant will be operated two, and possibly three, shifts."

Mullan.

The milling capacity of the Morning mine, at Mullan, the principal producer of the Federal Mining & Smelting Co., will be increased from 1500 to 2000 tons daily by Feb. 1, according to official announcement. This will give the Morning the most extensive treatment facilities of any property in the Coeur d'Alenes, with the possible exception of the Bunker Hill & Sullivan plants at Kellogg, and the equipment is of the most modern type. Extensive alterations to the Mammoth mill at Wallace now are under way by the Federal, and when the betterments are completed the plant will be placed in service as an adjunct to the Morning concentrator, probably in the next 60 days.

Kellogg.

The Kellogg United Mines Co., capitalized for 2,000,000 shares at 25 cts. each, has been organized by Spokane and Coeur d'Alene men to take over and operate three groups of claims in the Pine creek district. The incorporators are Samuel A. McCoy, J. A. McEachran, George H. Wilson and G. W. Sommer, all of Spokane, and Theodore Brown of Kellogg. "The new corporation practically is a consolidation of the Brown Leasing Co., the Kellogg-Sunnyside Mining Co. and the Coeur d'Alene Atlas Mining Co.," said McCoy. "The Brown has a lease on the Great Western group of claims, which it has been working for some time, concentrating its ores at the Sweeny mill, which is the property of the Federal Mining Co. There are 250 acres of ground

belonging to the Sunnyside and adjoining the property of the Lombardy Mining Co. The Atlas adjoins the Constitution on Pine creek and has 120 acres of ground."

Construction of the Bunker Hill Co.'s new \$1,000,000 smelter is progressing rapidly, according to General Manager Stanly A. Easton, and the plant probably will be completed and operating within the time originally set, some time in March, 1917. The superstructures for the furnace and refinery buildings already are well under way, the main stack is rising fast and construction in other departments of the mammoth reduction works is being rushed. The payrolls show that 275 to 300 men are employed in the work, and the force probably will be increased as the installation of the equipment progresses.

LAKE SUPERIOR.

COPPER.

Houghton.

Calumet and Hecla is milling daily about 10,800 tons, and is using all its stamps, reserving one stamp in each of its two mills in case of accidents. Osceola will have a monthly output of about 112,000 tons.

Hancock made an output of 23,927 tons last month, and will be increasing this figure considerably from this time on; the past month some openings had to be made more in the line of dead work.

Victoria will, it is thought, begin to pay a 50-ct. quarterly dividend, as with the November earnings which will be about \$30,000, it has with the copper being delivered about \$200,000 ahead.

Franklin has put its intensive system of mining into commission on the 30th level, making its second installation, the first being on the 29th. The two are sending up about 600 tons of the 1170 that are being hoisted. The last of the month the third installation will be made. A well-known engineer, who very recently inspected the two levels thus equipped, says that it is a great success, and is likely to be adopted in many mines here. The fact is known that a somewhat similar system is being perfected, and will be put into operation at another property within a short time.

Houghton Copper has made arrangements with the Copper Range railroad so that the track leading from Superior through the Atlantic subsidiary of the Copper Range, will be put in condition, so that its rock can be shipped to the Winona mill without the long detour that it now has to make. This step is thought to forecast a decision by the directors to further sink the shaft.

Adventure has made its first shipment of rock this week to the Winona mill which will handle it until such time as the company will put its own mill in repair. The rock is coming from the three upper levels, and for the greater part from the Butler lode, and is surprising all those who have seen it by its richness. The quantity will be gradually increased as fast as possible, and the unwatering will be kept up steadily until all the levels are completely drained.

Osceola's daily tonnage is about to the limit of its mill, about 4700 daily.

LaSalle's find on the 32nd level of the Osceola, extended into it for about 540 ft., will probably soon be sought for by a still lower level of the Osceola. It cannot be reached by any level higher than the 39th, as all those above on the Osceola have caved in.

New Baltic has entered the ledge with a fine showing of copper at the depth of about 65 ft. on the New Arcadian lode with extremely good amygdaloidal characteristics. Just as soon as possible the drilling will be begun.

Tamarack has been visited by its new president, State Senator Chas. S. Smith, of Massachusetts, who is also president of the Old Dominion and the Arizona Commercial mines.

Isle Royale has been inspected by Director F. L. Whitcomb, who has had stock and faith in the company for a long time, and is enthusiastic of its present and future. He

states that the policy of the management of enlarging the surplus by putting an amount equal to the dividends in the treasury, and that of opening up 2 ft. of copper ground for every foot taken out will be maintained, and that the tonnage will be considerably increased.

New Arcadian is putting down the rails from the 1250 to the 1500 level, and is able to run its hoist considerably now. The crusher is about in and the rockhouse engine will soon be installed. The rockhouse will be in commission about New Year's and then the normal quantity of work can be done.

Seneca's second option was secured by Tucker, Hayes & Bartholomew, who have the financial backing of the Lewisohn Brothers. W. F. Bartholomew has been for the past week in the Copper Country making plans for the opening of the mine.

IRON.

Ishpeming, Mich.

Considerable activity is being started to open iron-ore deposits in Sleepy Hollow adjoining the Lake Angeline which was purchased some time ago by Cleveland-Cliffs. The deposits which were located by drills during the summer are being stripped by Hoose & Person and production from this open pit will start next summer. Another Cleveland-Cliffs pit will be put in operation. This latter pit is at the extreme east end of the Lake Angeline.

The Cleveland-Cliffs Iron company has shipped about 3,365,000 tons of ore from its various mines and has about 5000 tons more to send out to complete its contracts of ore sold for this season's delivery.

Crystal Falls, Mich.

The small plant, with which the Amasa-Porter was developed and produced 50,000 tons during the past year, is to be replaced, according to General Manager Richards of the Judson Mining Co. It is intended now to install a larger plant and produce around 200,000 tons next year.

Ironwood, Mich.

A lease has been taken on the old Norrie iron mine and a company is being promoted by L. C. Brewer, mine operator, and George Rupp, mining engineer. Brewer states that they expect to start development work at once. It is the plan at present to open up the old Townsite shaft and make a thorough exploration of the property. The Townsite shaft, after being sunk to a depth of 400 ft., was abandoned during the existence of the Metropolitan Iron Co., and was never opened by the Oliver Co. while it was in control of the lease of the Norrie. Contracts have been let for modern electric hoists and other machinery, and it is expected that delivery will be made this month. Local contractors have been awarded the construction of the buildings on surface. The lease of the property for a period of 20 years has been filed with the register of deeds.

MISSOURI-KANSAS.

Joplin, Mo.

Owing to the general unsettled conditions in the spelter market prices of zinc blende receded to \$75 to \$95 per ton for the week closing Dec. 16th. On the other hand, lead ores advanced \$5 per ton, bringing from \$90 to \$100, the reasons assigned being purely local. This week's shipments also showed a remarkable turn-in based on the previous week's sales rather than this week's sales. For three weeks this month shipments have averaged 10,000 tons, which means that the annual output will break all previous records, both in tonnage and values.

A strike of ore accidentally made while drilling a water-well southwest of Joplin promises to inaugurate a prospecting campaign in a horizon hitherto not considered generally ore-bearing. The well was sunk upon the Renzenhauser farm south of Fillmore's bridge, southwest of Joplin, at which point the Grant Fall chert member of the Mississippian rocks outcrop. This member is the usual horizon in which ores are found in this field. The ore was found at

a depth of 153 or 157 ft. or 100 ft. below the usual horizon. The ore assays from 12% to 15% zinc blende.

Smith, Moore & Co. have made a bonanza strike on their tract of the O'Keefe land, near Twenty-eighth street. Miners who have mined in the South Joplin district declare the ore is the richest they have seen from the tract since the famous Octo, Brookfield and others operated there years ago. When the strike was first encountered, the dirt averaged about 10%, but the latest taken out will exceed 20%, it is believed. Those interested in the company are A. L. Moore, Steve Smith, John C. Emerson, Wm. Saylor, C. W. Smith and Leonard Vaughn of Joplin, and Herbert Wilson of Miami, Okla.

A rich strike was recently made by the Big Sandy Mining Co. The dirt averaged 12% and better, large boulders of free ore are being taken out, while the fine ore has considerable jack. About 100 tons of dirt were taken out last week.

The Independence Mining & Milling Co., situated on a 20-acre lease of the Old Wysbrod land in the East Hollow district north of Bell Center, is just developing a good face of ore in a shaft 102 ft. in depth. The company went into the ore last week and will have its first milling from the new strike this week, which is expected to be in the neighborhood of a carload. The company has its own mill of 150 tons capacity.

A good strike was made on virgin ground by the Chief Mining Co., situated on a tract of the Lee Taylor land, south of Tuckahoe. The orebody is just being developed and about 100 tons of good ore has been taken from the mine. Those interested are Bert McCall, Anton Danhagl; Walter, Charles and J. M. Neff; J. Barton and Joe Milligan.

John Good and sons have opened a good prospect on a lease of the Rader & Seals land in the Turkey Creek camp north of Joplin. Operation is being carried on at the 50-ft. level. The ore lies in disseminated ground and requires considerable shooting to break it. D. D. Adams is president of the company; E. D. Hicks is superintendent.

Leonard.

Dr. S. T. Carl, W. S. and J. C. Buchanan of Kansas, who own the Mamie S. Mine, which has first lease on 80 acres of the Empire Zinc Co.'s ground lying south of Twenty-sixth St., and east of Maiden Land, is opening a good property in old workings that were developed several years ago. This company has a 150-ton mill in operation and is pulling dirt from two shafts. Good ore bodies are being worked at the 85 level. The dirt averages about 9% zinc.

A seven-foot face of good lead dirt was struck at Saginaw by Charles Eads, Rolley Martin and J. B. Morsman. Several good mines, mostly silicate propositions, have been opened in the Saginaw camp within the last 3 or 4 years.

The Missouri Mining Co. are installing a new 150-ton concentrating plant at Thomas Station, including all modern equipment.

The Culbert Mining Co. at Four Corners have developed a rich mine; four faces of pay dirt averaging about 8% have been developed within the last few days. Operation is being carried on the 70-ft. level. A large derrick and 160-ton hopper is to be erected over the shaft from which dirt is being pulled, this week.

Webb City, Mo.

The Osage Zinc Co. of Webb City has taken out incorporation papers with a capital stock of \$30,000. The following are interested in the company: E. E. Fugitt, J. W. Ellis of Webb City, A. A. DeGraff, A. J. Mann and Fred C. Hill, Montrose, Mo.

MONTANA.

Butte.

The Butte Columbia Copper Mining Co. is getting under headway with its tunnel through the backbone of the continental divide, south of Columbia gardens. The company's property, approximately 600 acres, is equipped with a complete surface plant and the tunnel is now in a distance of

about 850 ft. It is the belief of the management that the property embraces some of the well-known veins of the district running in a general direction of northwest by southeast, and that it is in the ore zone which has been proven by developments at the Tuolumne, North Butte, Butte-Duluth and Bullwhacker.

At a meeting last week of the directors of the Butte Main Range Copper Co. J. J. Harrington, secretary of the Tuolumne Copper Co., was elected president of the former company. Other matter transacted was of a routine character.

The strike made by the Tuolumne at the Sinbad is attracting attention in that vicinity. The report for November shows an average daily shipment of about 125 tons. This has been handled partly at the Granby smelter and partly at the Pittsmont. The smelter returns show an average of over 3½% copper, while some cars have shown a much higher percentage. One car of 50 tons gave returns of 11.22% copper and 3 ozs. silver. The profits for November were greater than for the entire preceding 9 months, and the December returns will show still greater profits. The Wall syndicate, which is operating the Bullwhacker, is about to make a payment of \$50,000 on its option and receive in return 100,000 shares of the company's stock, under the terms of the contract. This makes a total of \$115,000 that has been paid and the acquirement of 230,000 shares of stock. The contract calls for eventually giving the operating syndicate a majority of the stock. With the present high price of both copper and silver and the increase in the output, the Bullwhacker is making money. All the ore being shipped is being taken from the 100 level. The manager hopes to get the tonnage up to 300 a day by the first of the year. The proposed railroad spur would be an advantage and would make a big saving in the cost for hauling.

Maxville.

Spokane men have obtained a lease and a bond for 3 years on the Buena Vista mine, situated 9 miles southeast of here. The property has not been worked since the fall of silver 20 years ago. Identified with the new organization are W. P. Russell, J. D. Chickering, F. Leslie, J. Millsbaugh, George P. Larson, J. P. Boyd, G. F. Russell, D. K. McDonald and Victor Rapp, of Spokane, and William Coleman, of Deer Lodge, from whom the property was obtained. The property is comprised of three claims, patented in 1883. Good ore was followed down a shaft. A tunnel will be driven to tap the shaft at a depth of 500 ft. The formation is granite and limestone. The main vein carries in width from 12 to 20 ft. and has a strike nearly east and west in granite. A parallel vein, nearly 300 ft. south, has a width of 12 to 16 ft. and lies in a contact between granite and limestone. The principal values are in silver, assays showing a content as high as 400 ozs. and some copper. The new owners have associated themselves together as the Buena Vista Mines Co., capitalization 15 units, all subscribed. G. F. Russell has been made business manager and J. L. Magney has been made operating manager. Underground operations and the repair of camp buildings have been started. All the mining equipment and the boarding house supplies have been shipped from Spokane.

Helena.

The East Butte Mining Co., in the Elkhorn district, is getting its mill along toward completion and should be running the first of the year. It is a large affair and will treat 300 tons a day; is also sinking its main shaft another 100 ft. The Rothfuss & Dickman mill is running and doing well. The Elkhorn Queen is shipping regularly and has a large body of ore.

Bannack.

Through a contract that has been entered into by an autotruck company with the Original Bannack Mining Co. ore shipments will be started by the first of the year. The contract calls for 100 tons a day and preparations are being pushed at the mine so as to be ready to care for the tonnage. Bins are being constructed, and the mine placed in readiness. At the present high prices for copper the mine can ship a large amount of ore which under normal conditions would have to be milled. The vein, that has been opened up by two shafts, shows ore for a length of 800 ft.

and a width of 40. The width of the vein averages from 3 to 4% copper and \$2.40 gold, with an excess of iron. In spite of the haul to the railroad, much of this ore can make a nice profit. On the foot-wall side of the vein there are 15 ft. of ore that will average 5% copper and \$3 gold. This is direct shipping material. The contract for hauling the ore becomes operative on Dec. 20, but it will probably be the first of the year before everything will be in running order.

Troy.

At the annual meeting of the Montana Morning Mining Co., held in Spokane, William Hogan, of Troy, Mont., was elected president, George W. Stannard, Kalispell, Mont., vice-president, and Stanley T. Wood, of Troy, secretary-treasurer. The officers, with Glenn B. Harrington and Joseph Rosslow, Spokane; E. S. Williamson, Kalispell, and D. T. Wood, Troy, compose the directorate. "Our company owns the property, has no outstanding indebtedness and is in position to finance further development," said Secretary Wood. "We expect to begin shipping a car a week of crude ore in the next 10 days, and probably will be able to continue production indefinitely. The property is traversed by several veins and that upon which we are engaged in mining has been traced on the surface for 150 ft. and opened by a shaft of 110 ft. and a tunnel in 500 ft. that have been connected. The shoot varies in width from 1 to 4½ ft. and has an average content of 35% in lead and zinc together, and some silver. Selection will raise the value of the product to 40 or 50%. Bins have been provided, and men are sorting. Another shoot has been encountered in an advance of the tunnel beyond the shaft. Another vein, has a width of 16 to 18 ft. and contains ore of a concentrating grade. Operations are proceeding on the L. & V. and other properties of the field where ore is exposed. Work on the big property of the Snowstorm Con. is nearing completion in its several departments."

Libby.

At a recent meeting of the stockholders of the Fairbault Mining Co. O. B. Nygard was elected president and John R. Lewis secretary-treasurer.

NEVADA.

Tonopah.

The local miners have accepted the wage increase offered by the Mine Operator's Association. Some opposition developed because the increase was based on the market price of silver, the additional wage to cease automatically with the dropping of silver below 70 cts., and a secret vote was taken to determine whether the offer be accepted or a strike called. According to well-informed miners the strike proposition was overwhelmingly defeated.

Sinking of the Victor shaft has been temporarily discontinued by the Tonopah Extension pending repairs. A heavy tonnage of excellent-grade ore is going to the mill from the Murray and North Merger veins, which at several points are yielding material across faces ranging from 12 to 15 ft. wide.

Goldfield.

The discovery of a strong vein of \$45 to \$65 ore in the Kewanas has stirred considerable interest. Found at a depth of 840 ft., and about 800 ft. north of the main working station, the vein averages 3 ft. wide and is gradually gathering additional width with developments. It occurs in the shale-latite contact and contains gold and copper. The company has increased its development crew and is prosecuting work at other points where ore indications are deemed favorable.

Goldfield Con. is devoting much attention to development of copper-gold ore in the Laguna and Red Top mines, where a large tonnage of this material has been demonstrated. Equipment for the first 500-ton unit of the improved flotation plant is in place, and an abundance of excellent-grade ore is available for treatment. The second unit will probably go into service on or before the 15th of February. Recent reports that important ore discoveries had been made

in the Grizzly Bear mine were without foundation in fact, as the company has not done any work in the Grizzly Bear for nearly a year. However, the lower portion of this mine is being developed under a lease arrangement by the Atlanta Co.

Within 10 days the shaft of the Grandma Con. is expected to penetrate the Wheeler vein, one of the strongest and most heavily mineralized ledges of the district. The shaft is near the 200-ft. level and should intersect the ore body within a short distance from the present working face. The Sandstorm-Kendall, Cracker Jack, Spearhead, Blue Bull, Great Bend and several other companies are exploring interesting ground. Shipments of high-grade ore continue to be made at intervals from the Great Bend.

Yerington.

The report that the smelter of the Mason Valley Mines Co. will be blown in at an early date has been confirmed by General Manager F. W. Guernsey. One of the two furnaces will be blown in within 6 weeks, and the other as soon thereafter as ore contracts warrant. With both furnaces in operation a force of 120 men will be employed and 1500 tons of ore smelted daily. It is reported that 1000 to 1200 tons of ore will be supplied the plant daily from the Bluestone group, owned by the Delamar interests. A large tonnage will be supplied by the Mason Valley mine, and ore also smelted for several California producers. A heavy tonnage of copper, gold, silver and lead ore is expected from the numerous small companies operating in territory tributary to Yerington.

Battle Mountain.

J. M. Pine reports the discovery of high-grade antimony ore in his Antimony King mine, north of Galena canyon. The shoot is 18 ins. wide, and besides carrying large quantities of antimony, contains considerable silver and some gray copper. The strike was made at a depth of 100 ft.

Cherry Creek.

This famous old silver district is again claiming a goodly share of the interest being manifested in Nevada mines by outside capital. From the Hunter mine much ore is being shipped, and several leasing companies are working along profitable lines. The Downer plant has been placed in commission and is stated to be making a high metal recovery from rather low-grade ores. The company owning the Mud Springs group has been re-organized, and \$50,000 is reported to have been set aside for future work. Numerous old producers in the district are being re-opened, and the general outlook is encouraging.

Rochester.

Construction of the 2-mile tramway from the Rochester mine to the mill is being rushed to completion. With the exception of a tube mill, in transit from the East, all mill equipment has been installed.

Las Vegas.

Las Vegas and Eldorado mining and business men have incorporated the Eldorado Mining & Milling Syndicate. The company will do a general custom mill business besides furnish water, light and develop the property upon which the townsite is located. This incorporation also owns the townsite and will dispose of the lots, using the money derived from this source to assist in developing the property. With the establishment of a custom mill, properties in Eldorado Canyon will begin shipping. Heretofore they have been forced to remain idle on account of being unable to mill the ores.

I. R. Landis and Peter Buol have organized and are now incorporating on the following claims: Helen M. Porter, Cycle, Evans, Dewey, Mary H, Longfellow, Combination, Combination No. 1, Combination No. 2, Triangle, Nelson No. 1 and Nelson No. 2, the last two claims adjoining the townsite of Eldorado. Landis will go to Los Angeles next week and purchase hoist, compressor and other machinery. Active operations will begin within 2 weeks.

The management of the Eldorado Enterprise have been mapping out a big development campaign for this property. The ledge in the tunnel is widening, the assays showing good values. It is the intention to install a plant of machinery on this fine property in the near future to facilitate

development. The Enterprise is a very promising youngster.

Frank A. Doherty, Geo. A. Fayle, Hugh Welk, and others, have formed the Eldorado-Good Springs Gold Mining Co. and are incorporating on the Texas group, a splendid property near the Wall Street mine. Active development will begin at once.

Work has been started on the M. & D. group, known as the Black Prince in Copper canyon. High grade copper has been mined in property.

NEW MEXICO.

Mogollon.

At the Pacific mine, construction work is about completed to effect hoisting from adit level to collar of shaft. The ore will be dumped into chute to crusher, thence by belt conveyor to feed bins at terminal of aerial tramway to Socorro's mill. At present a large number of burros are employed moving old ore dump to terminal station.

A new headframe has been installed at collar of shaft on Trilby group, and sinking and drifting will be started at once. Supt. James, who has had considerable experience in Alaska mining centers, is in charge of the work, representing the estate of the late Capt. Kirkpatrick.

The Oaks Co. has resumed sinking of shaft on the Meridian claim. This is a fraction lying between the Top, on the east, one of the properties under operation by Mogollon Mines Co., and the Confidence group on the west, which together have produced five or six million dollars to date. Although surface rights are restricted, the fraction is considered quite valuable, as it embraces a constantly increasing length of this important vein as depth is gained.

Work has been started on the Grand Central claim, one of the promising locations in camp.

At the Gold Dust group, a winze is being sunk on an ore body about 900 ft. from portal of lower tunnel. Crosscuts at various points are also under way.

The Oaks Co. is doing work on the Susje and other claims in vicinity. A cut sample assaying \$14 is reported for width of breast in South drift from bottom of shaft on Eberle mine, one of the Queen vein properties.

Socorro Mining & Milling Co. shipped 13 bars of gold and silver bullion from operations covering last half of November, a total of 31 bars for the month, from a treatment of approximately 6900 tons of ore.

Bullion output of Mogollon Mines Co. for last half of month past was 12 bars, making a total of 20 bars for November. Ore reduction for the past 30 days was 4000 tons.

On Dec. 1 the Oaks Co. paid its initial dividend of 1% on preferred stock issued. It is understood a like amount will be disbursed monthly for an indefinite period.

OREGON.

Lebanon.

At the Crown mines good discoveries have been made and preparations are under way to ship the ore to the smelter at Tacoma. The principal value is zinc. R. E. Peery is manager.

Sumpter.

The Columbia mine, which has been in continuous operation for 20 years, has been closed. For about a year the mine has been a subject of litigation which is now pending. It is thought that this has influenced the closing of the mine, as it still contains known commercial ore. About a month ago the mill was closed. At that time it was the intention to continue underground work during the winter. Pulling the pumps completes the shut down and the mine will be allowed to fill with water. Recent work in the mine cut new water courses, increasing the flow of water to the point where it was with the greatest difficulty that pumps kept it down.

SOUTH DAKOTA.

Deadwood.

The Cuyahoga Mining Co., according to J. H. Snyder, vice-president, who was recently in the city from the Southern Hills, states that the company is sinking the main shaft to the 200 level and has reached a depth of 160 ft. to date. In going down the shaft passed through 40 ft. of the vein, and for nearly all of its depth has been in pyritic ore. After the 200 level has been reached a station will be cut and drifts made on the vein. The company has been making regular shipments of ores to chemical works at Cleveland, O., and recently sent 2 cars there which will average 43% sulphur. These shipments will be continued while the development of the property is proceeding. The mine is not primarily being opened for pyritic ores, for on the hanging wall of the vein which has been uncovered is 11 ft. of ore which contains from \$4.50 to \$60 in gold. This part of the vein is now receiving attention and when it has been opened arrangements will probably be made for the erection of a mill. The company is also talking of erecting a plant for the manufacture of sulphuric acid, and it may be started in the spring.

At present expectations are to start the mill of the New Puritan Co. in the spring. At the mine drifting has been in progress from a station on the 160 level of the main working shaft. It has reached a point directly beneath the quartzite ore body and is expected to cut the ore body on its dip. Raises will be made from the drift and the ore drawn off from the levels which will be run on it into cars and taken to the main shaft.

Hill City.

The Hill City Production Co. began the smelting of its own tin concentrates on Dec. 14. The results were satisfactory and a considerable amount of concentrates are on hand waiting to be smelted.

UTAH.

Milford.

Moscow mine, in Star district, 10 miles southwest of Milford, is controlled by Matthew Cullen and associates, Salt Lake, and is under the management of G. S. Wilkin. The ore occurs in limestone, cut by east-west fissures. Among these is one main fissure, extending from monzonite on the west to quartzite on the east. It has a width ranging from 2 to 60 ft., and has a dip of 35 to 45° north. The ore not only occurs in this main fissure, but in shoots in the adjacent bedded limestone. These limestone beds strike north-south and dip east. In this formation, north of the main fissure, are two great ore shoots, 200 ft. apart, which have a pitch to the east of 45°, corresponding to the dip of the bedding planes; and there are numerous other minor ore shoots. In the big fissure are bodies of lead carbonate, carrying silver, and carbonate of zinc below the lead stopes; also detached lenses of zinc sulphide. The grade of the lead carbonate is about 17% and 15 ozs. silver, 20% iron and 15% silica. The zinc carbonates contain 30 to 35% zinc; the zinc sulphide runs over 38% and 11.8% lime. About 1000 tons of zinc sulphide ore is blocked out in the big fissure. The ore in the shoots, occurring in the lime beds, is more continuous and of higher grade than that of the main fissure. In the bedded formation it has been found continuous from the surface to 1100 ft. depth, except where faulting occurs. Here the lead carbonates carry 30 to 40% lead, and 15 to 40 ozs. silver. At and below the 1100-ft. level are bodies of sulphide ore, running 15% lead, 30% zinc, 1% copper, 6 ozs. silver. On the higher levels copper carbonate ore has been found contiguous to the lead bodies. It runs 10% copper and is accompanied by some silver and zinc.

The principal ore shipments consist of lead carbonates, amounting to 500 tons per month; the zinc carbonate ship-

ments are now running about 90 tons per month. The sulphide shipments are variable. The net production of the mine, after hauling, railroad freight and smelting charges are paid, has amounted to \$100,000 to \$150,000 per year during the last 5 years. There is a wagon haul of 9 miles to Laho station, costing \$1.65 per ton.

The property has been developed and is being operated through three vertical shafts. The old shaft, 200 ft. deep, and the Cullen shaft, 500 ft., are 300 ft. apart, and situated at the old camp on the west side of the divide; the new shaft, 1100 ft. deep, is on the east slope of the range, 2000 ft. east of the old camp. The collar of the new shaft is 300 ft. lower than that of the Cullen. The workings on the west side and those on the east side are connected by drifts and inclines. At present the greater tonnage of ore is coming from the Cullen workings, but eventually the new 1100-ft. shaft will be the center of operations. The Cullen shaft is near the apex of the ore zone, which dips toward the east side. In the new shaft the ore body was caught on its dip at 1100 ft. depth. This fact, demonstrating that the ore bodies are persistent to that depth, is of interest to other operators in that district, among which are the Commonwealth, Cedar, Talisman and Leonora.

The new shaft has two compartments for hoisting and one for ladderway. It is equipped with a Wellman-Seaver-Morgan double-drum electric hoist, and an electric driven air compressor, 700-cu. ft. capacity. Besides using compressed air for drills, it is used for operating the hoist at Cullen shaft and several underground hoists for winze work. Water at the camp is supplied from a well in the valley. This requires an electric-driven pump, forcing water through a 5-mile pipe line, and making a lift of 1000 ft. Beaver River Power Co. has a hydro-electric plant in Beaver canyon, 20 miles east, which furnishes the power.

WASHINGTON.

Spokane.

Approximately \$50,000 is to be expended in further development of the Lead-Zinc Mining Co.'s holdings near Metaline, and in additions to the mill and in diamond drill exploration of undeveloped ground, according to Lewis P. Larsen, president and general manager of the corporation, who was in Spokane recently. It is announced that New York men have become heavily interested in the property, and that finances for the contemplated work is being provided by them. "We now are employing 25 men, but the force probably will be increased to between 40 and 50 by January 1, when we hope to have the mill completed and operating. The capacity of the plant now is 125 to 150 tons daily, but it will be increased soon to 250 and a flotation system installed. A new hoist and compressor plant, each actuated by a 100-hp. electric motor, are being placed in the mine, which will be in shape for steady production when the concentrator is finished. The sources of production include a shoot opened for a length of 600 ft., having a width of 25 to 75 ft. and a metallic content averaging 10%. There is ore in the faces, so the extent of the ore body is not known. Diamond drilling is to be conducted from the 550 level. The property, which is of large area, embraces several veins. It has been opened by a shaft, tunnels and other workings for 3000 to 4000 ft. Our mine is unique in its possession of free zinc sulphide ore. It contains no iron. We have made a metallic recovery of 62.7% in tests by flotation, and expect to make 62% concentrates when a maximum of efficiency is attained in the plant. We will separate the lead and zinc and float the slimes, producing perhaps 25 to 30 tons a day of high-grade concentrates. A mill of larger capacity will be built at the lower level ultimately."

The Loon Lake-Blue Bird Copper Mining Co., capitalized for 1,500,000 shares at 25 cts. each, of which 500,000 shares are to be held in the treasury, has been incorporated by Andrew Laidlaw, H. H. Schallenberger, Lester P. Edge, Joseph McCarthy and M. L. Moe, all of Spokane, to take over and develop the Blue Bird and Dupont claims, adjoining the Loon Lake Copper Co.'s holdings, 45 miles north of Spokane.

Charles E. Agnew, of Sharpville, Pa., and J. C. Haas, a local mining engineer, also are interested in the corporation. "The same veins from which the Loon Lake Copper Co. is extracting present shipments for the Trail smelter extends into our ground," said Mr. Schallenberger. "The ledges are clearly defined within our lines and the surface showing on the Blue Bird, which was the first claim located in the camp, is regarded as the largest and most promising in the district. We intend to rush development as rapidly as possible, and work will begin as soon as a crew can be recruited and supplies and material assembled. The Blue Bird claim was located 20 years ago and a shaft 82 ft. deep was sunk about that time. According to men who worked at the property there is a fine showing of ore at the bottom of this shaft, the dump showing some excellent chalcopryite. The principal surface showing is on the Blue Bird a few hundred feet from the Loon Lake Copper workings. The malachite and azurite quartz is apparently identical with that obtained from the original surface workings on the O. K. claims of the Loon Lake Copper Co."

Articles of incorporation of the Coyote Mining Co. have been filed with the county auditor at Colville. The capital stock is fixed at \$250,000 with shares of \$1 each. The trustees are J. E. Herron, L. W. Cook and George Osterhout, all of Northport.

Water in large volume has appeared in the shaft of the Loon Lake Copper Co. This suggests proximity of a ledge for which we will crosscut when the 300-ft. depth is attained. The shaft, sunk from the 200 level lacks 10 ft. of its objective. Three carloads of ore are in transit. A check for \$1800 has been received on a lot of 33 tons shipped Nov. 17.

Dayton.

The Nisling Mining company held its annual meeting last Tuesday. Officers and directors were elected as follows: C. H. Day, president; George Spalinger, vice-president; A. F. Applton, secretary, and J. W. Jessee, treasurer. The directors are William Chandler, George Brown, J. W. Imlay, W. F. McCauley and John Romain. Reports from the officers and a detailed statement by the company engineer, Robert Smart, of the work for the year were received.

WISCONSIN-ILLINOIS.

Platteville, Wis.

Returns for the field for week ending Dec. 9 showed deliveries to track of 149 cars of zinc concentrate, 5800 tons. Heavy shipments seemed to be in order for low grades to reduction plants. Four cars of lead ore were shipped, 124 tons, in all. Pyrites came in volume from the Mineral Point Separating Co., 427 tons; National Separators, 377 tons; Linden Zinc, 80 tons, and Optimo mines, crude pyrites, 74 tons. Production was fair considering the fact that severe winter weather retarded milling at many points, a total of 5000 tons of mine run ore being turned in. Net deliveries of high grade ore from reduction plants to smelters were light, 2300 tons, with an additional 14 cars of high grade under contract direct from mines to the Grasselli Chemical Co., 577 tons.

Local producers were again light on mine-run ore, the Hodge sending 3 cars to Cuba, 133 tons; West Hill Mining Co. high grade to La Salle, 32 tons; Bell Mining Co. initial shipment to La Salle, 28 tons, and Utt-Thorne Co. small lots, 14 tons.

A sharp decline was experienced in the price of blende, the base receding to \$93 per ton for standard grade or down to \$89 for medium and second grades. Under 50% zinc content was in good demand at \$1.20 per unit.

Benton, Wis.

Shipments for the week of Dec. 9 totaled 56 cars, 4,554,000 lbs., of zinc concentrates. Three of the 4 cars of lead ore from the field came from this section. Frontier Mining Co. and Wisconsin Zinc Co. were tied with 10 cars each for a combined total of 815 tons. New Jersey Zinc Co. to Mineral Point from the Fox and Penna-Benton mines, 4 cars

each, 329 tons. Fields Mining & Milling Co. to Mineral Point, 2 cars, 70 tons, and to Grasselli, 3 cars, 120 tons. Vinegar Hill Zinc Co. to Cuba from the Blackstone, Martin and Kitzoo mines, 6 cars, 242 tons. Indian Mound Co. to Wisconsin Zinc roasters, 2 cars, 88 tons; Grand View Mining Co. to Linden Zinc, 35 tons, and Sally Mining Co. to Cuba, 37 tons. Benton roasters were in on the high grade shipments, sending 2 cars, 83 tons, to American Zinc of Illinois. Skinner roasters to American Zinc, 3 cars, 120 tons; American Metals Co., 2 cars, 88 tons; American Zinc & Lead Smelting Co., 1 car, 43 tons, and to Eagle-Picher Lead Co., 5 cars, 207 tons.

A rich strike was completed at the Buchan mine where after great tribulation the shaft was put down to the ore bed and good deposits are being opened up. A small sinking plant will now be replaced with a complete modern mining establishment.

Highland, Wis.

National Zinc Co. of Springfield seems to have established itself in this district. The Saxe-Lampe Mining Co. shipped 2 cars high-grade carbonate, 60 tons, and New Jersey Zinc Co. to Mineral Point, 30 tons. Lack of water, for which diligent quest is being made with drills, is halting the operation of a new mill at the Kennedy mine and withholding employment from a force of 50 men.

Linden, Wis.

The Spring-Hill Mining Co. makes its initial shipment with 1 car of zinc delivered to the Benton roasters, 40 tons. Saxe-Pollard are sending from 8 to 10 cars out weekly to Mineral Point, the Gilman mine offering most of this yield. Stoner, Ross and Optimo mines sent between them 4 cars to separators last week, 146 tons.

One of the rare finds of the year in zinc ore producers is being opened up fully on the Gilman property for the Pollard-Saxe Co. At present a recovery of 25 tons of zinc concentrate is made each 9-hour shift and shipments have been made weekly to the Mineral Point Zinc Co. in volume, the report for week of Dec. 9 accounting for 10 cars, 345 tons. A 10% recovery of lead ore is being made in milling. Other shippers for the week were Stoner Bros., Ross Bros., and Optimo companies.

Miffin, Wis.

Shipments of zinc ore continued with 15 cars going to track. The Cokers are making a light run due to lack of water supply for milling. Drilling operations are being extended on the Big Tom property. Shipments of high grade jack are regular. Grunow Mining Co. is improving its output. Peacock Mining Co., one of the dividend payers of the field for 1915, is running conservatively and new equipment has been installed.

Dodgeville, Wis.

Much excitement has been occasioned in this camp by recent developments on the Ed Berryman farm. A rich strike of zinc ore was made in deepening an old well. This well was deepened to go through the glass rock and a sheet of zinc ore 14 ins. thick was cut. Some of the miners engaged in this section claim it is an extension of the McKinlay range.

Shullsburg, Wis.

The Mulcahy mine, a new producer, shipped 12 cars of high-grade separator ore to Edgar Zinc Co., 440 tons. The Winskill mine sent 3 cars to Skinner roasters, 117 tons. Rodhams & McQuitty Co. are putting the finishing touches on a new 100-ton mill.

Galena, Ill.

The few producers who reported were heavy on zinc ore last week, the Black-Jack sending 8 cars to Mineral Point, 320 tons; Graham mine and North Unity to Cuba made 5 cars, 215 tons. The Birkbeck mine, a new Wisconsin Zinc Co. producer, is now opened up to better advantage and giving evidence of its value as a producer, 7 cars going to separators last week, 283 tons. The plant is one of about 40, built in the field during the year and a heavy production is predicted regularly.

The Ophir Mining Co., a recent organization, is developing a strong east-west lead range on the Stephen's farm. The shaft has reached a depth of 108 ft. and is in fine lead ore. Shipments will commence this week.

WYOMING.

Cody.

The Midwest Sulphur Co. is in the midst of prosperity, as its product has been sold into the fall of 1917. Officials state that on this account an addition will probably be necessary to the plant which now has a capacity of 200,000 lbs. daily. The new brimstone pit near the plant can now be driven into for a distance of 40 ft., and the sulphur walls are 30 ft. thick. It looks like a 2 or 3-year proposition according to present conditions.

Casper.

Another well has been brought into the Big Muddy field in the shallow sand formation. The Standard Exploration Co., drilling for the Merritt Oil & Gas Co., made the strike at a depth about equal to the other shallow wells in the field. Tankage was ready for the coming in of the well and it was quickly hooked onto a pump and is today producing a little better than 500 bbls. daily. Both the upper and lower sands are now proved producers in this field.

Kemmerer.

The Plains Oil Co., Kansas City, is going to develop the La Barge oil field, 35 miles north of here. A company has also been formed to develop a field at Fossil, 15 miles west of here. A rig will be put to work there within a few weeks.

Conroy.

The Rock Springs Fuel Co. was recently organized and has taken over coal mines near here which belonged to the Wyopa Coal Co. Much reconstruction work has been found necessary and a force of 70 men is being employed. Two shifts are working and some coal is being produced.

CANADA.

BRITISH COLUMBIA.**Illicillewaet.**

The new mill of the Lanark Mining Co., a 150-ton daily capacity plant, now is more than half completed, and it is believed that it will be ready for service not later than Feb. 1, according to reports from William B. Dornberg, general manager. The company is controlled by Spokane interests, and money is available to finance construction of the concentrator and other betterments to the property that are contemplated. Large quantities of ore ready for mill treatment have been blocked out and much of it broken down. Because the mountain is too steep to permit of storing much ore, there has not been much work done in the mine pending the building of the mill.

Silverton.

Dividends will be paid quarterly by the Standard Silver-Lead Mining Co. after the end of the current year, according to announcement accompanying the regular monthly report to stockholders. Heretofore disbursements have been made monthly. The company operated at a loss in October, but the deficit will be more than balanced by sale of accumulated zinc concentrates, now being shipped. Among other things the loss results from a reduction in the receipts on preliminary shipments, which were \$26,386 in October as compared with \$33,066 in September, and a reduction in the zinc sales, which were \$8593 in October, as compared with \$17,137 in September. "We have not shipped any accumulated zinc concentrates, of which we made 500 tons this month over our regular shipments, worth approximately \$15,000," says Charles Hussey, secretary, in the report. "At the date of this statement, Dec. 11, we have commenced shipping our accumulated zinc concentrates, estimated to amount to 3000 tons, worth about \$30 a ton net. At the last regular monthly meeting the directors decided to pay all future dividends quarterly on account of the long distance from the transfer office and the great amount of detail connected with monthly disbursements." The surplus at the end of October was \$202,669, as compared with \$264,319 at the end of September. The receipts for October were

\$46,670, as compared with \$61,149 in September, \$18,824 in February, \$180,943 in March, \$131,309 in April and \$88,227 in May. The disbursements for production, tramming, milling, power, shipping and selling, taxes, insurance, casualty insurance, salaries and general expenses were \$37,114. They differ little from those of any other month except February for which they were less. These figures show a relative operating profit of \$9555 in October as compared with \$24,188 in September, \$143,065 in March, \$93,542 in April and \$55,443 in May. There was a relative operating loss of \$8,743 in February. Disbursements in October for development construction work in the Aylard and No. 7 tunnels and store supplies were \$10,867, which is higher than some months and lower than others of the current year.

Nelson.

The Granby Co. proposes to carry out extensive diamond drill operations on its properties at Phoenix. It has given a contract to Boyle Brothers, who have moved their outfit from Lake Chelan, Wash., to the Granby properties.

ONTARIO.**Cobalt.**

The McKinley-Darragh-Savage Co. has purchased a 17 by 5-ft. ball mill from the Power & Mining Machinery Co., Milwaukee, Wis., and this will be in operation by February, 1917. The new mill will take care of the ore which formerly went to the 50-stamp mill, which will be cut out entirely. At present, underground work is centered in raising from the 400 to the 250 level. By Feb. 15 these levels will be connected, and will permit ore to be hoisted from the 400 direct to surface.

Though development has been satisfactory to date more of it is needed before the Peoples' Mining Co. can have a fair chance. The second vein has been cut in the crosscut above the contact. The No. 1 vein, cut some time ago, has been drifted on for 75 ft. It is 8 ins. wide and looks promising. The No. 2 vein carries some cobalt and is fairly strong. At the place where cut the vein is about 8 ins. wide. This vein will be drifted on also and possibly some raises put up. Silver has not yet been found in the vein, but the character of the vein is such as to warrant possibilities.

Kirkland Lake.

At the Wright-Hargraves buildings, including an assay office, have been erected and a \$25,000 plant installed. The main vein has been traced for a distance of 2800 ft., and has a width of about 12 ft. It shows mineralization of fine consistency. At the east side of the property this vein contains values of a good milling grade. About 1800 ft. west, near the center of the property, the main shaft is located, in which high-grade values have been encountered. Surface exploration has exposed the vein at 1000 ft. west from the main shaft. Here the vein is 14 ft. wide, and contains average values of \$50 per ton across its entire width.

Porcupine.

The new south shaft at the Davidson is down over 50 ft. and at that point a vein was encountered. It is 5½ ft. wide of quartz, and a channel assay over that width assayed \$7.20 gold. There is also a pay streak 42 ins. wide in the center of the vein which went over \$40.00. The main vein is showing up satisfactorily at depth. Financial arrangements have been completed whereby the company is assured of no less than \$400,000 for development work. It is planned to explore the 300 level thoroughly and at the same time work along the ore body on the two upper levels. On the 300 they picked up the main vein some weeks ago but owing to unavoidable delays have not yet reached the hanging wall. The values are about the same as those on the 100 and 200 levels, where a large body of high grade milling ore is being blocked out. A mill may be built in the spring of 1917.

A contract for extensive diamond drilling has been awarded Smith & Durkee for holes varying from 500 to 1000 ft. deep on the property of the Apex Co. The main shaft will be sunk 300 ft. further, work commencing with 2 machines running three shifts. Crosscutting will be done south to the Dome Lake line to intercept the ore body on that property, which is understood to run into Apex at the southwest. It will also drift on the main vein towards West Dome where free gold showings were uncovered on surface.

World's Index of Current Literature

A Weekly Classified Index to Current Periodical and other Literature, Appearing the World Over Relative to Mining, Mining Engineering, Metallurgy and Related Industries, in Four Parts.

Part 1. *Geology*—(a) Geology; (b) Ore Genesis; (c) Mineralogy.

Part 2. *Ores and Metals*—(a) Metals and Metal Ores;

(b) Non-Metals.

Part 3. *Technology*—(a) Mines and Mining; (b) Mill and Milling; (c) Chemistry and Assaying; (d) Metallurgy; (e) Power and Machinery.

Part 4. *General Miscellany* (including Testing, Metallurgy, Waste, Law, Legislation, Taxation, Conservation, Government Ownership, History, Mining Schools and Societies, Financial, etc.

Articles mentioned will be supplied to subscribers of *Mining and Engineering World* and others at the prices quoted. Two-cent stamps will be received for amounts under

\$1. Subscribers will be allowed a discount of 5 cts. if the price of the article exceeds 50 cts. The entries show:

(1) The author of the article.

(2) A dash if the name is not apparent.

(3) The title, in italics, of the article or book. Titles in foreign languages are ordinarily followed by a translation or explanation in English.

(4) When the original title is insufficient a brief amplification is added. This addition is in brackets.

(5) The journal in which the article appeared; also the date of issue, and the page on which the article begins.

(6) Number of pages. Illustrated articles are indicated by an asterisk (*).

(7) The price.

December	55.038	26.232
Year	49.690	23.470

Difference in domestic and foreign prices explained by the fact that the New York quotations are per fine ounce; the London per standard ounce 8.925 fine.

Copper.—Whatever metal speculators dumped upon the market was readily absorbed especially in that price concessions of 1½ cts. a lb. were available. Electrolytic for the first quarter was sold down to 33½ cts. as against the former price of 34¼ cts. Spot casting copper was sold at 32 cts. as against 35 cts. First quarter prime lake copper sold off to 33¼ cts. as against 34½ cts. Second quarter electrolytic dropped to 32½ cts. Speculative interests took the peace movement as a cue for short selling of third and fourth quarter electrolytic and it was in these positions that the largest price concessions were offered, third quarter delivery being quoted by these interests at 30½ cts. as against 31½ to 32 cts. asked by the producers, while fourth quarter was offered as low as 29¾ cts. as against 30¾ to 31 cts. asked by producers. With metal available from resellers at concessions the producers did only a small business, most of which came from consumers who preferred to deal with interests who were sure to make deliveries. The producers are confident that as soon as the market absorbs the resale copper the prices will return to their former levels. Of course, the stopping of short selling for future deliveries will not be so easy, but this is a problem for which the producers will no doubt soon find a panacea.

Foreign demand for copper dropped flat on the German announcement but domestic buying was a good volume. The opinions of leading producers who were interviewed as to the possible effect that peace could have on the copper situation can be summed up as follows: "There can be no serious underselling for the first half for the simple reason that there is little copper to sell for that period. If peace should materialize the price of copper for the last half of next year will be regulated by the demand. We believe that the present rate of production need not undergo any contraction even if peace develops early next year. We still are confident that Europe will consume enormous amounts of copper for reconstruction purposes and that the world consumption will remain as large as it has been over the past year if not possibly increase. If underlying conditions indicate that consumption of copper would be affected by holding prices above 25 cts. then the price will be lowered to around 20 cts. or to any level where it will be compatible with stimulating consumption rather than putting a burden on absorption. It is fortunate both for the producer and the consumer that the output for the first half of next year

is sold out, as this condition will militate against any uncertainty and prove beneficial in maintaining a strong situation over the period of readjustment in Europe. A consumer who paid above 25 cts. for his first half copper need not fear that the market will go lower before that copper is consumed. Generally the consumer of copper is in as strong a position as the producer, having sold finished products against his forward copper purchases."

The situation at London has developed no essential change what with the government putting into effect new regulations affecting consumption. London prices are now fixed by the government and while they show the leanings of the officials who fix the prices they are of no earthly value or importance.

Quotations for copper per pound at New York for the week ended Dec. 20 were as follows:

	(For First Quarter Lake.)	Delivery.) Electrolytic.	Casting.
Dec. 14.....	34 @ 34½	34 @ 24½	32 @ 33½
15.....	33¾ @ 34	33¾ @ 34	32½ @ 33
16.....	33¾ @ 34	33¾ @ 34	32½ @ 33
18.....	33 @ 32½	33 @ 32½	32 @ 32½
19.....	32½ @ 33	32½ @ 33	31½ @ 32
20.....	32½ @ 33	32½ @ 33	31½ @ 32

Note—These are prices quoted by second hands and are applicable only to the small lots held by these sellers. Producers' prices remain unchanged.

Quotations for copper per ton at London for the week ended Dec. 20 were as follows:

Dec.	Standard		Electrolytic	
	Spot.	Futures.	Spot.	Futures.

Tin.—This metal seemed to secure a new lease of life with the advent of peace on the horizon. Ever since the detailed statistics were announced on Dec. 1 tin has been receding and while the downward movement has not been entirely stopped the recessions are not so severe or frequent. As previously pointed out in these reports tin is expected to have its prosperous days after the war, when Germany and Austria are again buyers in the open market. The English consumers, especially the Welsh tin plate makers, will also benefit by peace and increase the consumption of tin abroad. This favorable development combined with the large American consumption will, it is expected, result in a sharp upward movement of prices. Business done in the past week has been small, due mainly to the disinclination of sellers to part with futures. The permit situation is slightly easier, but there is still a goodly amount of tin to be released by England, permits for which were asked over a month ago.

Spot Straits held around 43 cts. and then eased off to 42½ cts. The limits from the east for April, May and June sailings have been around 41½ cts. For January arrival sellers have been asking 42½ cts., with February and March arrivals quoted at 42 cts. Banka tin on the spot is scarce, but December arrival has been offered at 41¼ cts. Foreign markets receded last week, but the recessions were due mainly to the government restrictions on trading rather than to technical conditions of the market. Arrivals since the first of the month total 910 tons with an aggregate of 6393 tons afloat to this country. All indications point to ample arrivals this month.

Quotations for tin per lb. at New York and per ton at London for the week ended Dec. 20 were as follows:

Lead.—The boom in lead has been cut short by the German peace move, this development bringing out a number of resale lots which were offered at concessions ranging from 1 ct. to 1½ cts. Producers, however, being sold up for January and in some cases even over February and March ignored the weakness of spot. For the first time in many months lead futures were quoted higher than spot. Second hands who were holding lead for higher prices dumped their holdings on the market at prices ranging from 7¾ cts. down to 7½ cts. New York. This compares with 8¼ cts. paid for spot lead immediately prior to the German announcement. Demand fell off coincident with the weaker spot market. Producers being well sold up are not forcing business, being content to wait for a definite trend towards peace before engaging in price concessions. Lead is fairly well entrenched to meet the ending of the war, and aside from softness on the part of second hands no decided reaction is expected. At London the prices have remained unchanged at the government maximums. Quotations for lead per lb. at New York and per ton at London for the week ended Dec. 20 were as follows:

Lead Ore.—In the Missouri-Kansas-Oklahoma district lead-ore prices were still on the increase during the week ended Dec. 16 and concentrates were sold at from \$90 to \$100. A cold wave hindered production somewhat, but during the week it was sufficient to allow shipments totaling 2,482,100 lbs., which were valued at \$111,951. The total for the year was 101,831,212 lbs., valued at \$4,213,239.

Zinc Ore.—Zinc-ore concentrates in the district during week were still on the decline insofar as prices were concerned and a \$5 drop brought the second grades to \$75 and the better grades to as high as \$95. There were shipped during the week 19,268,160 lbs. of concentrates valued at \$836,199, and this brought the total for the year to 697,291,097 lbs. valued at \$28,152,375.

Calamine.—The market for this ore was fairly steady and prices ranged from \$40 to \$55. The week's production was 685,960 lbs., valued at \$16,854, and the year's production was 37,618,450 lbs., valued at \$1,114,523.

Splter.—Peace is what splter producers have dreaded, using this phrase from a business and not humanitarian standpoint. What the turning loose of German splter production means to the American producer is too well known to require elucidation here. Suffice to say the splter market acted according to form following the German bid for peace. Prices were on the down grade before the German move, but the decline took on more speed afterwards. Second hands who were liquidating became rather frenzied and spot prime western sold as low as 10½ cts. Short selling of futures added to the weakness of the market, first quarter prime western dropping to 10 cts., with second quarter down to 9½ cts. St. Louis. Very little business was done on the decline. Consumers being well posted on splter, condi-

tions were not attracted by the concessions. Their point of view is that while peace may not eventuate at this time the position of spelter is such that the price will not go above 15 cts. again, so that it is good business to limit spelter purchases, taking advantage of the ups and downs of the market. Producers missed a very fine opportunity to dispose of first quarter output about 3 weeks ago when there was a very good demand and prices were around 12½ cts. The producers were waiting for better prices. Since the reaction some of the producers have been seeking business at prices below that which they could have obtained a few weeks ago. That the market is ignoring conditions that would in other times stimulate prices is shown by the fact that prices are dropping in face of curtailed production in the west due to cold weather. At London spelter dropped to £2 in spot and £2 10s in futures last week.

Quotations for spelter per lb. at New York and per ton at London for the week ended December 20 were as follows:

Dec.	14.	15.	16.	18.	19.	20.	New York		London

MISCELLANEOUS METALS.

Antimony.—Business has been very dull with the market holding barely steady. Chinese interests having large forward contracts at high prices, some as high as 35 cts. still to fill, are content to quote 14½ cts. for spot, but metal can be obtained under that price, probably as low as 14 cts. from some second hands. Some munition makers were recent buyers, but demand has been sporadic and many handlers report difficulty in interesting consumers.

Aluminum.—Conditions continue unchanged with the market quiet but uncertain as to tone, due mainly to the German peace overtures. Spot virgin ingots while quoted at 63 to 65 cts. may possibly be shaded, as some sellers are beginning to feel the suspense based on the prospect of peace.

Quicksilver.—There has been no change in the situation, the market holding steady at \$80 per flask. Supplies have been a little more plentiful, some buyers satisfying their needs after having first reported inability to secure sizable lots.

Ferro-Manganese.—Scarcity of ores has forced the price of ferro-manganese upwards, some domestic makers quoting as high as \$175 delivered, this price comparing with business done at \$155 delivered a fortnight ago. There is a good demand for ferro-manganese for shipment next year, and with English makers indicating that they are unable to take much more business, it is predicted that the domestic product will soon sell up to \$200 delivered.

Tungsten.—Nervous holders of tungsten began to offer freely on the German peace announcement. In order to understand the tungsten situation it must be borne in mind that a considerable amount of this metal is held by speculators who bought when prices were above what they are now and have been holding on hopes of recovering the lost ground. England and France have just been in the market taking both prompt and forward ores, paying from \$16.50

to \$18 per unit, the outside price being paid for Argentine ore. A prominent domestic consumer is now in the market and has been quoted from \$17.50 to \$20 per unit.

Molybdenite.—An advance has been made in molybdenite, handlers quoting \$1.80 to \$2 per lb. for MoS₂. There is a very active demand, but supplies are small.

Manganese Ore.—Increases in ocean freight rates have forced higher prices on manganese ore, especially the Indian ore on which some sellers are asking as high as 78 cts. per unit at tidewater. Brazilian ore is quoted at 70 cts. tidewater, but a large consumer in eastern Pennsylvania reports being able to buy some Brazilian ore at as low as 60 cts.
